

# YSoft SafeQ Private Cloud

Centralization of IT systems and services makes managing your entire print infrastructure easier and helps to ensure system reliability. IT staff spend less time connecting separate servers and setting the same options over and over again on multiple servers.

**YSoft SafeQ Private Cloud enables you to manage servers centrally. Thanks to this architecture, the solution saves you time and significantly reduces the cost in deploying to many branches and on-going maintenance.**

## Central Management

- Manage all servers at all locations from a single Web-based interface.

## Job Roaming

- Print your job in London and collect your documents in New York.

## Central Reporting

- Create a report detailing print costs across the entire company and find the sources of high expenditure.

## Load Balancing & Failover

- Ensure efficient and reliable print services with automatic workload distribution and server clustering.

YSoft SafeQ Private Cloud is an essential IT management tool for organizations with multiple branches and offices. Setting up and managing servers at multiple locations has never been easier. From a single Web page, IT staff can control the entire system, change settings and create detailed reports.

**YSoft SafeQ ensures optimum communication between the central server and remote locations—and printing services at remote locations continue even if communication with the headquarters fails. What's more, you can save at least 95% WAN data bandwidth.**

## Central Management

Central Management allows total control of the networked print environment from a single location. To minimize network traffic, YSoft SafeQ can be deployed and configured both centrally and remotely and in addition, all print data does not have to travel over your wide area network. Print data is managed in each location separately by a YSoft SafeQ Smart Agent.

The YSoft SafeQ administrator dashboard enables IT staff to monitor the entire system. The dashboard provides information such as system health, current workload status and an overview of all print system operations.

The YSoft SafeQ dashboard enables the administrator to immediately react to any situation that occurs anywhere in the network and act fast to keep services running.

## Central Reporting

Central Reporting enables easy and automatic collection of information across all of your organization's branches and offices. Thanks to its unique architecture, YSoft SafeQ only transfers relevant information and the data link between headquarters and branches is kept to a minimum.

YSoft SafeQ Central Reporting serves organizations of all sizes, from small businesses with just a few branches to large corporations with hundreds of subsidiaries and offices worldwide.

## Job Roaming

Job Roaming provides a "higher level" of follow-me functionality which will be typically appreciated by users who travel between your company's offices. All print jobs sent to YSoft SafeQ in one location can be released anywhere in the YSoft SafeQ network and with no geographic limitation.

**Job Roaming requires only minimal data transfer. To optimize network traffic, Job Roaming uses two methods of job distribution:**

- **Near location** – job information is synchronized immediately, so the user can collect their prints in other locations without delay.
- **Far location** – job information is downloaded when the user logs in at the terminal. This method is used for locations separated by great distances.

## Load balancing & Failover

YSoft SafeQ supports various methods to ensure the continuous operation of critical components and to reduce the impact to users if a component fails.

If a server fails or communication with the central server is interrupted, another server immediately and automatically takes over.

Thanks to load balancing, YSoft SafeQ can manage millions of pages per month. During printing, YSoft SafeQ decides which server should accept the job to optimally split the workload amongst servers.

"Our IT staff has found YSoft SafeQ simple to administrate. They appreciate the centralized structure and reporting system, which makes the management and service of the entire printing network very easy and flexible.."
