

Reduce Charting Time From Hours to Seconds

Are you capturing and manually documenting vital signs in Med-Surg? Do they often end up on exam gloves, alcohol wipes and scraps of paper? And does it take hours to transcribe or key those vitals into the electronic medical record?

With Capsule's SmartLinx Chart Xpress, periodic vital signs enter the patient's record electronically, before the clinician leaves the bedside. Utilizing the SmartLinx Neuron 2 mobile clinical computer, Chart Xpress connects to your existing spot check monitors and wirelessly sends validated vital signs to the electronic medical record. Vitals are reviewed and validated at the point-of-care, so clinicians don't have to log in to another workstation or carry another handheld device.

Designed with nurses for nurses, Chart Xpress is intuitive, flexible and easy to use. It can be configured to any clinical workflow, and can accept additional vital signs parameters unique to the care environment.

The result? Chart Xpress eliminates time-consuming, error prone manual entry of vitals during or after rounds, literally reducing charting time from hours to seconds. The care team can devote more time to direct care activities and less time in charting.

Enhance clinical decision-making

- Faster entry of vital signs into the medical record
- Accurate charting of vitals and patient-specific information

Increases time for direct care

- Simplifies established clinical workflows
- Vital signs are filed to the patient record at the point-of-care

Cost-effective

- Adds connectivity and documentation to all leading spot check monitors
