

Crisafulli Provides Cost Effective Pumping & Dredging Solutions for the Mining Industry

Owners, Operators, and Environmental Service Contractors Rely on Crisafulli Products.

Crisafulli products are the GOLD STANDARD in the mining industry

We Offer:

- Remote-controlled Dredges
- Manned Dredges
- Submersible Pumps
- Floating Pumps
- Floating Platforms

SRS Crisafulli is a Montana USA based manufacturing and engineering company with over 5,000 customers worldwide. SRS Crisafulli manufactures, sells, and services high capacity, high performance pumps, dredges, and power units to customers throughout the United States and in over 29 countries.

In the United States and Canada, SRS Crisafulli also rents dredges. Our products are used in a wide variety of applications including transfer of fluids in large volumes, from clear water to slurries with high concentrations of solids in solution, and dredging of municipal and industrial wastes, including toxic and non-toxic materials.

Crisafulli Mining Expertise

SRS Crisafulli personnel provide solutions and equipment capable of handling resource recovery, retention pond waste removal and environmental remediation.

Our breadth of experience is global. We have provided dredges, pumps, dewatering equipment, power units and floating platforms to a variety of mining industries:

Gold	Bauxite
Silver	Hydrotalcite
Copper	Zinc
Uranium	Salt
Barite	Clay
Peat	Lignite
Coal	Soda Ash
Molybdenum

supported by superior service worldwide

Resource Recovery

Waste streams and tailings ponds are becoming more valuable due to improved processing technologies. From clays to gold, Crisafulli products help improve the bottom line. Most tailings ponds contain very fine solids with valuable product trapped within. The highly efficient Cobra cutterhead easily slurries the solids to be reprocessed and enables our customers to recover valuable historically lost product. The slurry process enables mines to keep their ponds in service, eliminates the need to dry the ponds, and eliminates unwanted dust.

Retention Pond Waste Removal

Both active and abandoned mine sites have potentially hazardous waste products, including acid mine drainage, in their retention. Lime and other reagents are used to capture these materials and hold them in a lined lagoon. Crisafulli cutterheads and pumps effectively remove this contaminated substrate so that it can be landfilled in lined dumps. The Crisafulli liner protection system enables operators to dredge lined lagoons without fear.

Environmental Remediation

As waste material accumulates in retention ponds, the available storage space declines. This creates the potential for hazardous waste spills. To prevent spills during high water events, operators need to clean their ponds and maintain containment capacity. Crisafulli dredges can be used to feed dewatering equipment to clean ponds and haul material offsite. We can work in corrosive environments without disrupting operations or harming the environment.

Dredge Rentals

We offer rentals throughout the US and Canada on our full line of dredges. If you are interested in purchasing but would like to check it out first, ask about our "Try Before You Buy" program which allows you to rent the dredge and if you make your purchase decision within the first 30 days, SRS Crisafulli will apply 100% of the rental fees toward the purchase price.
