## Tube Nuts

Most BrakeQuip tube nuts have two distinct features for easier installation & dismantling.

1. **A small step on end of the thread**  
– This allows for easier installation because the step acts as a guide & makes it easier to start the thread. It also gives the thread clearance at the end which eliminates the problem of flaring out when over tightened. If this happens, the nut can be very difficult to remove & can some times destroy the thread when removed.
2. **A thread relief under the hex** – apart from looking more professional, this allows the nut to be screwed down right up to the hex if necessary.

- Zinc plated for corrosion resistance

Bleeder Buster Kit

PART NO.  
BQ2200

It is as simple as 1, 2, 3.  
Works every time.

1. Place filler wire into end of bleeder and cut to length.
2. Install tool into your air chisel and shock bleeder from the top.
3. Unscrew bleed screw with conventional tool.

How does it work? Installing the wire plug into the bleed screw prevents the walls of the bleed screw from collapsing when removing. Applying impact to the bleed screw for about three to four seconds will compress and work harden the bleeder screw and "shock" the threads free.

Note: The "compressed" bleed screw will need to be replaced after removal.
