DID YOU KNOW?

Some female fittings were designed with locating and directional profiles to enable the novice installer to route the hose correctly. This meant having both left hand and right hand fittings. BrakeQuip designs these fittings with a locating profile only which then makes this fitting able to fit both sides of the vehicle.

DID YOU KNOW?

Most female fittings with a bulkhead mount use a 5/8" x 18NF thread and this is the only thread that BQ supplies. However some of these fittings come with a M16 x 1.5 or a fine brass thread. If in doubt, supply a BQ13 nut with the fitting.

DID YOU KNOW?

Some banjo fittings have the banjo hole offset from the center as a locator on the caliper. By reducing the offset amount from the opposite side also allows the banjo hole to be in the center and able to fit both sides instead of just one side only.

DID YOU KNOW?

Some flared tube style fitting are deliberately made longer to make it more universal. This enables you to bend the tube to the desired shape and allows you plenty of room to place the BQ23 test spade under the nut for testing.

DID YOU KNOW?

BrakeQuip makes the round style banjo fittings that only has one bend in a straight form to allow you to easily bend the banjo shank to the desired shape. You can usually bend these banjo fittings up to 90° by using the available banjo bending tools.

DID YOU KNOW?

Fitting manufacturers design their fittings to suit what resources are available to them. For instance, some manufacturers make their female fittings with a 3/4" hex to give them a shoulder to mount to but others prefer to make them from 5/8" hex and then supply a shoulder clip for the shoulder to mount to. BrakeQuip supplies these in both styles. Therefore the following applies. HFIF01 = HFIF36, HFIF02 = HFIF24, HFIF05 = HFIF45 and vice-a- versa.

Bracket Mount

DID YOU KNOW?

Have you noticed all the different profiles in particular on female fittings between the retaining clip groove and the mounting shoulder? You will find this corresponding shape in the chassis or bracket where the fitting mounts. This is designed so that the hose is routed with the correct orientation. It is very important to note this orientation when assembling brake hoses. It is particularly important to make note of the orientation before you cut off any fitting you are going to reclaim with our lifesaver. Once you cut it off you have lost your orientation reference.

DID YOU KNOW?

There are three different flare types.

1. A 45° double flare – the inverted seat angle is 42°
2. A 45° ISO flare (Bubble) – the female seat angle is 96°
3. A 31° DIN flare (Mushroom) – the female seat angle is 120°

The seat angles vary to the tube angle because it is important to seal the smallest diameter to get an effective seal.

DID YOU KNOW?

It is impossible to stock every fitting. That is why BrakeQuip supplies lifesavers to fill in the gaps. Currently BrakeQuip offers five different lifesavers to suit the different fitting situations. This makes it easy and efficient for you to reuse the original fitting. The HF01 & HF26 are virtually the same and are designed for most standard fittings. However these have a tubing countersunk in them so that you can easily braze tube directly to them to make up custom fittings. The HF27 is designed to suit all the fittings that have a 5/16" (8mm) tube attached to it. The HF120 is designed to reuse all banjo fittings that have 7mm shank such as the HFB09. The HF05 is designed to reuse all center support fittings.

DID YOU KNOW?

It is important to match a banjo bolt to the correct banjo fitting. If the banjo fitting hole is "scalloped" out then it doesn't matter if the banjo bolt has a groove at the inlet port. The fluid flow can be restricted if you use a banjo bolt that does not have a relief at the outlet port into a banjo fitting that does not have a recessed hole.

Bracket Retaining Screws (PKT 50)

This thread forming screw is required to secure bracket to bracket mount fittings.

DID YOU KNOW?

The purpose of the circular groove on the fitting crimp shell is three fold.

1. It helps to differentiate BQ fittings from others
2. It acts as a depth guide for the hose installation
3. It is used as a crimp setting guide for the economy crimping systems.

DID YOU KNOW?

Copper washers or brake fluid compatible bonded washers should only be used for sealing the high pressures found in braking systems. Aluminum and nylon washers are for low pressure only and should not be used on braking systems.

DID YOU KNOW?

The gramophone finish on some banjo fittings are designed to increase the sealing power of the copper washer. It is usually on banjo fittings that have a large flat face.

DID YOU KNOW?

If you study the design on the heads of banjo fittings, you will find that there are hundreds of different designs. The reason this is so is because the design engineer has to ensure that the banjo fitting cannot rotate once installed. If the banjo fitting was able to rotate counterclockwise, then this could loosen the banjo bolt and thus create a leak and ultimately brake failure. It is important that this is taken into consideration when selecting banjo fittings.

DID YOU KNOW?

BrakeQuip supplies two sizes of compression fittings in both steel and stainless steel (3/16" = HF30 & 1/4" = HF31). These have been added to the range of fittings to cater for the power trim hoses on boats and clutch hydraulic hoses. It is not recommended for use on braking systems.

Tube Nuts

Most BrakeQuip tube nuts have two distinct features for easier installation & dismantling.

1. **A small step on end of the thread**
– This allows for easier installation because the step acts as a guide & makes it easier to start the thread. It also gives the thread clearance at the end which eliminates the problem of flaring out when over tightened. If this happens, the nut can be very difficult to remove & can some times destroy the thread when removed.
2. **A thread relief under the hex** – Apart from looking more professional, this allows the nut to be screwed down right up to the hex if necessary.

FEATURES:

- Male & Female
- Imperial & Metric Threads
- Various tube sizes
- Zinc plated for corrosion resistance

Remove Frozen Bleeder Screws like a Pro...Easily

Introducing the new Bleeder Buster Tool Kit

No more heating up
No more drilling and tapping

No more hammering
No more cursing

BQ2200

- Can save you a lot of time.
- Pays for itself very quickly.
- Works on both cast iron and aluminum.

It is as simple as 1, 2, 3. Works every time.

1. Place filler wire into end of bleeder and cut to length.
2. Install tool into your air chisel and shock bleeder from the top.
3. Unscrew bleed screw with conventional tool.

How does it work? Installing the wire into the bleed screw prevents the walls of the bleed screw from collapsing when removing. Applying impact to the bleed screw for about three to four seconds will compress and work harden the bleeder screw and "shock" the threads free.

Identify Fittings in 60 Seconds or Less

One of the biggest time wasters is time spent identifying the fittings. BrakeQuip has designed a system around the fitting catalog so that you can identify a fitting in seconds once you have identified the thread if applicable. The first thing you need to do is understand the fitting numbering system.

For crimp style fittings, BrakeQuip has 9 different product groups and all start with HF (Hose Fitting). Usually if it is not a crimp fitting, the part number will start with BQ (BrakeQuip).

Follow these steps for systemizing this quick find process:

1. Decide which fitting group the fitting falls under.
2. Select the fitting style or the way it is mounted. Use the Fitting Catalog contents section at the front of the catalog until you get familiar with catalog.
3. This narrows your search down to a couple of pages or less. Identify what is unique about the fitting and focus on this point in the Catalog.
4. Confirm your selection by checking that all the important attributes match the fitting you are seeking.

NOTE:

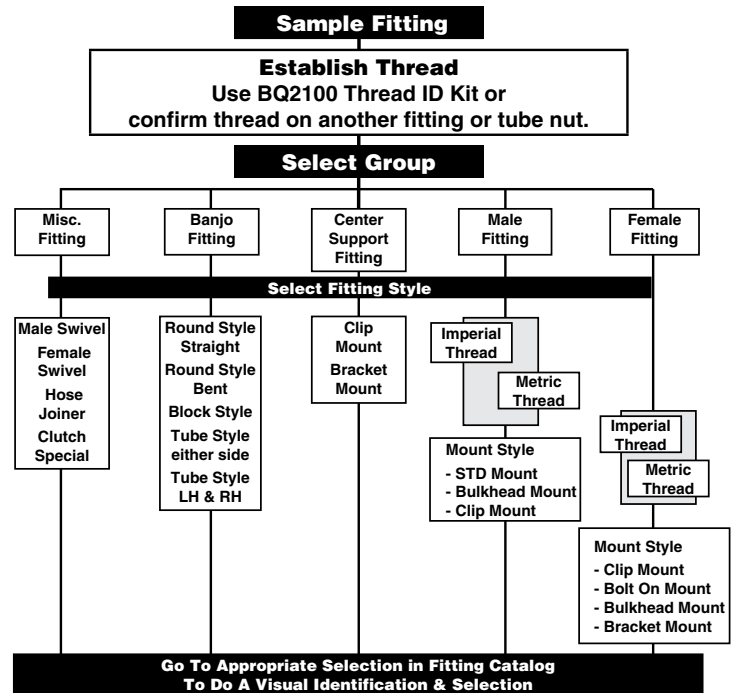

Not all fittings look the same as the original but will still function properly. The three important points that you need to consider are:

- A. Can the fitting be secured properly - Is there a mount or shoulder profile that will clash?
- B. Will the working end at the connection match up and seal?
- C. Does the hose need something to direct it away from rubbing or heat.

ABBREVIATION	DESCRIPTION
HF	Miscellaneous
IM	Imperial Male
MM	Metric Male
IF	Imperial Female
MF	Metric Female
B	Banjo

NOTE: Imperial = American Standard

Note: To search electronically - go to www.brakequip.com - products - brake hose fittings.

Hose Fitting Numbering System

HF = Hose Fitting (These two letters are used for computer number finding only.)
Fittings that don't fall into one of the categories below have the prefix HF only.

EDUCATIONAL INFORMATION

Identifying the Correct Thread

THREAD FACTS

Worldwide there are only two measuring systems - Metric and Imperial. Sometimes the imperial measurement is called SAE or American.

Metric systems measure the thread by the distance between two thread pitches expressed in millimeters. Example: M10 x 1 = The OD of the thread is 10mm and the distance between each thread pitch is 1mm. Imperial systems measure the number of thread pitches over a one inch length.

Example: 7/16" x 24NS = The OD of the thread is 7/16" and the number of thread pitches over a one inch length is 24.

After some experience of looking at threads and knowing what vehicle the fitting came from, you will be able to determine fitting threads by just looking at them.

Determining if the thread is metric or imperial

The easiest way is using a thread gauge. We offer a thread identification kit (BQ2100) for this purpose that covers the majority of threads you will encounter working with brake plumbing. Another method could be to use a brake hose fitting or tube nut from which you could confirm the thread and size.

1. Determining the fitting OD

- a. If a male fitting - Measure the OD of the thread. Take into account that this measurement will be slightly under the nominal size.
- b. If a female fitting - Measure the ID of the thread. Compare this measurement at the distance between the "valleys" of opposing pitches with corresponding male fittings.

2. Determining the thread pitch

- a. If it is an imperial size - Count the number of thread pitches over say 1/2" length and then multiply by 2 to get your T.P.I. (Threads Per Inch).

A GLOBAL GUIDE TO THREAD SELECTION

European (excluding UK)	99% Metric
Asian	99% Metric
UK (1930 - 1976)	Imperial
UK (1976-2008)	Metric
USA (1930 - 1980)	Imperial
USA (1980 - 2008)	Metric & Imperial

- b. If it is a metric size - Measure the distance between two thread pitches to determine the thread pitch.

Imperial Threads found on braking systems

3/8" x 24NF 7/16" x 24NS 9/16" x 20NS
 3/8" x 20BSF 1/2" x 20NF
 7/16" x 20NF 9/16" x 18NF

Metric Threads found on braking systems

M9 x 1 M10 x 1.5 M12 x 1.25
 M10 x 1 M11 x 1.25 M12 x 1.5
 M10 x 1.25 M12 x 1 M14 x 1.5

80% of threads found on braking systems are:

3/8" x 24NF
 7/16" x 24NS
 M10 x 1

The two sizes most confused because they are so close in dimension are:

- a. 3/8" & 10mm. A 3/8" x24NF thread will screw in to a M10x1 but a M10x1 will not start into a 3/8" thread. If uncertain, always go for the M10x1 to see if it will start in the thread.
- b. 7/16" & 11mm. The 11mm thread is extremely rare so always going for the 7/16" thread first is a safe bet.

NOTE

It is possible to have metric on one end and imperial on the other end of the hose.

The metric pitch is the same for all sizes, so if you don't have the exact one you want, you can determine this pitch by selecting a different size metric gauge.

TIPS ON USING THE BQ2100 THREAD GAUGE

Gauges are organized into popularity groups:
 Blue = Most popular Metric threads
 Red = Most popular Imperial threads
 Gold = Less popular Metric threads
 Green = Less popular Imperial threads
