

Automated Test Equipment

Power to your next innovation

Automated test systems require a high throughput and costs should be as low as possible. A power supply in an automated test system should not spend its time with command processing, up/down programming and responding to transients because these are the key factors leading to a low throughput. Costs for a test system often increase because a multitude of units have to be programmed a synchronized. Our portfolio comprises power supplies dedicated to high throughput with a lot of additional functionality integrated.

- Increase your test speed up to 100 times with power supply dedicated for ATE.
- Reduce setup time drastically with integrated current read-back, sink capabilities and arbitrary waveforms.
- Use one unit for the whole range of power test instead of several and save rack space.
