Technical Bulletin: CAD app SDK is now available

You asked for it and we responded! In January, Cardinal introduced a new feature of Cardinal Consumer Authentication, the CAD (Consumer Authentication Device) app. The CAD app allows cardholders to generate an OTP (One Time Password) on their mobile device.

What's New?
After receiving feedback from our Customer community, Cardinal developed a Software Development Kit (SDK) that enables a Financial Institution (FI) to integrate the CAD app functionality of generating OTPs into their current mobile banking app.
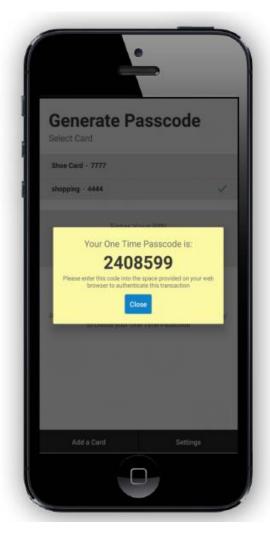

How does the SDK work?
The SDK was created with ease of use in mind. The CAD functionality is very simple to add to your current mobile banking application. The SDK will allow you to create a simple activity that includes the functionality of adding/activating a card, generating OTPs and deleting a card. The goal is to setup your current mobile banking app environment to connect to the CAD service.

How do I get the SDK?
Simply contact the Client Management team and let them know you are interested in the CAD SDK.
