Reduces Migration Costs

The expense, time and risk associated with manually extracting data from legacy archives can make migration prohibitive, leaving you with islands of data and escalating maintenance bills.

TransVault Migrator quickly and securely moves your email records to a new archive service, while freeing up your old archive servers and storage.

You can also take advantage of TransVault's advanced filtering capability to streamline your new archive by migrating only the data you need.

Fast, High-Fidelity

Depending on your environment and target archive, TransVault's high performance engine can migrate extremely high volumes of data at a time, ensuring nothing is lost in the process.

Each individual item is tracked, and if the migration of any item fails, TransVault automatically re-tries. You can also migrate while your legacy system is still archiving, relying on Migrator to detect and move any newly added data.

Reports detailing exactly how much data has been moved and any permanent failures (usually due to corruptions in the archive) are also available.

Advanced Shortcut Management

The unique Mailbox Services Engine converts legacy shortcuts to work seamlessly with the new environment. It can also:

- Ensure shortcuts are put into the correct folders post-migration.
- Not move data where shortcuts have been deleted.
- Control the amount of shortcuts created to avoid mailbox overload.

No other migration route offers as much flexibility.

Enhanced Compliance

Some organizations have a legislative requirement to retain data – and ensure its integrity - for years, even decades.

TransVault Migrator protects from obsolescence, enabling organizations to decommission legacy archives safe in the knowledge that their data is in a future-proof, readily accessible format.

It maintains a complete audit of all data transfers and generates detailed reports to ensure chain-of-custody for each individual item migrated.
