

HEAVY DUTY OVERSEAS SHIPMENT

Strong and built to withstand G-forces on the open ocean.

This 50 foot long international shipment loaded out of San Diego CA weighed in excess of 160,000 lbs. Inspection doors have been incorporated into the container sides at four points allowing additional anchor points for ship board tie downs to the actual machine.

A steel base provides cable lifting points allowing the concentrated load to be transferred to each corner of the container. On board tie downs aren't necessary since the container's design compliments standard practices aboard ship.

Heat treated wood is always used in the construction of all Valley Box containers. In order to ensure no corrosion will take place during this overseas shipment, the product is encased in a vapor barrier bag with the proper amount of desiccant added.
