U.S. Coast Guard Hangar at LAX

Size: 39,300 Square Feet

Location: Los Angeles, California

Challenge *Worn Metal Substrate*

- Repair and maintain aged metal panels.
- Remove, replace and re-coat rusted sections.
- Provide a durable coating that can withstand updraft from helicopter rotor blades.

Solution *AcryShield® Roof Management System*

- The AcryShield Roof Management System along with the replacement and re-coating of heavily rusted sections will protect the metal from the harsh conditions of jet fuel and salt water in the air.
- Title-24, white reflective coating will help keep the temperature down inside the large metal hanger in the hotter summer months.
- Coating system is much more economical than the widespread replacement of rusted panels.

The AcryShield Roof Management (ARM) System allowed the US Coast Guard to maintain their existing roof, eliminating any tear-off costs and loss of time due to tear-off procedures.
