

## Improving speed and accuracy with your deposit process.

Using a Tellermate electronic cash counter with DTS CONNEX™ makes it easy to prepare a deposit. A person preparing the deposit simply takes each denomination that will make up the deposit and places it on the Tellermate T-iX. Each denomination is counted to determine the number of notes that are present and the total value.

Using the T-iX eliminates human error and the entire deposit can be counted in less than 60 seconds. Once all denominations have been counted, the T-iX displays a summary that allows the cash room personnel to be able to review it. Once the deposit is finished, the T-iX transmits the deposit amount directly to DTS CONNEX™ eliminating unintentional errors.

In DTS CONNEX™, the deposit amount is now visible. A bag number and an optional employee number is entered and the deposit is created. By pairing Tellermate's T-iX with DTS CONNEX™, you will find that the ease of use, efficiency and time savings is truly remarkable.

**"The average US retailer has monthly bank deposit discrepancies of 3%"**

## Real Results: Top US wireless communications retailer

After a comprehensive pilot of five stores in Atlanta, GA, a top wireless communications company fully adopted Tellermate electronic cash counters into their more than 3,000 corporate and franchised locations and integrated with their deposit tracking software (DTS CONNEX™ from IFS Services, Inc.).

*"Usability was the main reason Tellermate was selected. The ability to have Tellermate software customized to match our existing manual processes was HUGE in gaining the acceptance of our associates."*

### Top US wireless communications retailer

The time and cost saving benefits of Tellermate cash counters were easily seen after the pilot was complete. An **81% reduction in the time** it took to count cash allowed employees and managers to reallocate their time to prepping the sales floor and better serving customers. The **100% accuracy** the stores were now seeing in deposits, counts and automatically transmitting to DTS CONNEX™, resulted in a reduction in bank discrepancies that **saves the company \$5-10K per month**.

## Deposits

### TRACK THE DEPOSIT THROUGH THE FULL DEPOSIT LIFECYCLE

#### With DTS CONNEX™

DTS CONNEX™ knows when a deposit is created, when it has been picked up by an armored carrier, when it is credited and when it has been counted, and if it is adjusted.

### AUTOMATIC NOTIFICATIONS OF ADJUSTMENTS

DTS CONNEX™ provides automated notification when a deposit is adjusted by the bank. This notification can be emailed to Store Managers, Headquarters, Regional Managers, or almost anyone.

### KNOW WHO CREATED THE DEPOSIT AND HOW OFTEN THERE IS A DEPOSIT ISSUE

DTS CONNEX™ automatically tracks who creates deposits and then matches that against POS data, bank adjustments, and deposit timing to show employees who may be of interest to Loss Prevention.

### ADDS UP DEPOSIT AMOUNTS FOR EMPLOYEE

DTS CONNEX™ automatically adds up denominational amounts, preventing transpositional errors. Some retailers credit this simple process with reducing adjustments by 30%.

### INTEGRATES WITH TELLERMATE CASH COUNTERS

DTS CONNEX™ can take data feeds from the Tellermate T-iX. These amounts are automatically placed into DTS CONNEX™ for easy creation of a deposit, thus saving time and reducing errors.

#### Without DTS CONNEX™

The deposit shows up in bank reporting for the location (unless it doesn't reach the bank).

Adjustment notifications are often mailed to the store or headquarters.

Some retailers ask employees to initial a deposit ticket when it's created. Then if there is a problem, they will request images of deposit tickets to see who is responsible. They will then accumulate this data over months to try and assign responsibility.

Many employees use ten-keys to add up counted deposit information. This leads to incorrect totals being added up and written on the deposit ticket. This can lead to adjustments which are both time consuming and expensive.

Unintentional shrink is common when entering deposit information. Transposing numbers or hitting the wrong key. This error can be very costly with little or no accountability.
