

We recognize that our customers' needs change as the industry progresses. We gladly work with our customers to develop the right processes for their ever-changing needs.

### **Past Projects**

In the past we have worked with companies from many industries including defense, medical and semiconductor to find the best solutions for their unique requirements. Some of our recent processes include ultra-thin ferrite substrates, filled via processing of glass interposers and sapphire processing for micro-electronics applications.

### **Communication**

These types of breakthroughs are achieved by continual communication between customer and vendor. Typically a mutual non-disclosure is recommended and executed by both parties prior to beginning the project. It is important that we are involved as early as possible in the development of your unique application in order to avoid misconceptions about material capabilities.

### **Qualifications and Experience**

Centerline's staff includes multiple experienced machinists with extensive background in processing various materials. Our key employees have been involved with processing of advanced materials for over 30 years.
