

OSHA Safety Sign Standards Update

OSHA Signs

With OSHA's regulatory update for workplace safety signs, organizations can either use their current OSHA signage which follows the American National Standard Institute (ANSI Z53 and Z35 1967-1968 standards), or new signage that incorporates the latest ANSI Z535 standard (2013).

OSHA adopted the new ANSI standard to better communicate safety messages in the workplace. The recommended new visual signage depicts updated headers, greater use of symbols and in some instances, consequence and avoidance statements.

This new line of facility safety signs gives organizations the opportunity to elevate safety communications in their operations. Organizations will increasingly adopt the new sign formats which will eventually replace the previous standard OSHA signage used for many years.
