

The Scannabar System: *Fast, Accurate and Easy as 1,2,3*

1.

Merchandise is received from the supplier, tagged and scanned into inventory. Each unit is assigned its own unique serial number--which allows for each individual unit and its contents to be tracked from stockroom to bar, and bar to bar, until its contents are fully depleted and it is scanned out of inventory.

2.

Physical inventory is performed at each bar. Empty bottles are scanned out of inventory. The contents of partially-filled bottles is precisely measured using a handheld barcode scanner and Scannabar's patented measuring strip. The procedure takes 15-20 minutes for a typical bar, and data is wirelessly transmitted to your back-office computer in real time.

3.

Scannabar instantly updates inventory levels. Importing data from your POS system, Scannabar analyzes and compares both inventory and sales figures, redflags any discrepancies and generates a variety of useful, money-saving reports--including variance analysis, movement, measure, global inventory and re-order reports.
