

FOR IMMEDIATE RELEASE

Veloxis Pharmaceuticals Chooses TrialMaster® EDC for Risk-Based Monitoring

Fort Lauderdale, FL, March 11, 2015 - OmniComm Systems, Inc. (OmniComm) (OTCQB: OMCM), a global leading provider of clinical data management technology, today announced that after a rigorous evaluation process of various commercially available EDC technologies, Veloxis selected TrialMaster EDC to run its Phase IV clinical studies.

TrialMaster's risk-based monitoring capability was a significant factor in the selection decision. The ability to collect and utilize many types of key risk indicators and subsequently adapt source data verification (SDV) requirements in response to risk was important in Veloxis' decision. Now Veloxis will no longer solely depend on on-site monitoring, and will have access to more information remotely, minimizing on-site SDV activities.

Due to the unique nature of these studies, Veloxis specifically sought technology that would be easy to learn and intuitive to use for their investigative sites. Designed with compliance in mind, TrialMaster EDC conforms to both the US Food and Drug Administration (FDA) and European Medicines Agency (EMA) risk-based monitoring draft guidance. TrialMaster's depth and breadth of capabilities will ensure data quality, accelerate study setup, and provide enhanced site experience.

"The continued adoption of TrialMaster in the late phase market is a direct result of our strong development focus in this area over the last few years," said Kuno van der Post PhD, senior vice president of business development at OmniComm Systems. "Our guided data entry and strong site focus as well as our most recent innovations, such as patient direct data entry and data grids, offer our clients a clear advantage in late phase."
