Counterfeit detection types:	Infrared (IR) detection Ultraviolet (UV) detection Magnetic (MG) detection Watermark identification
Features:	Effective detection of CDN & US banknotes Effective detection of bills from around the world Automatic start Power saving mode Visual reference guide

C990 Infrared Counterfeit Detector

Protect your money by eliminating counterfeit bills with the easy to use C990 Infrared Counterfeit Detector.

The C990 is designed to catch the most complex counterfeit bills by simultaneously using Infrared (IR), Ultraviolet (UV), Magnetic (MG) and Watermark technology.

Four Types of Counterfeit Detection

Infrared detection can be used to authenticate over 60 different world-wide currencies including Canadian & US currencies.

Ultraviolet and Watermark are used to assist in determining the authenticity of banknotes, traveler's cheques, credit cards, ID's and most driver's licenses.

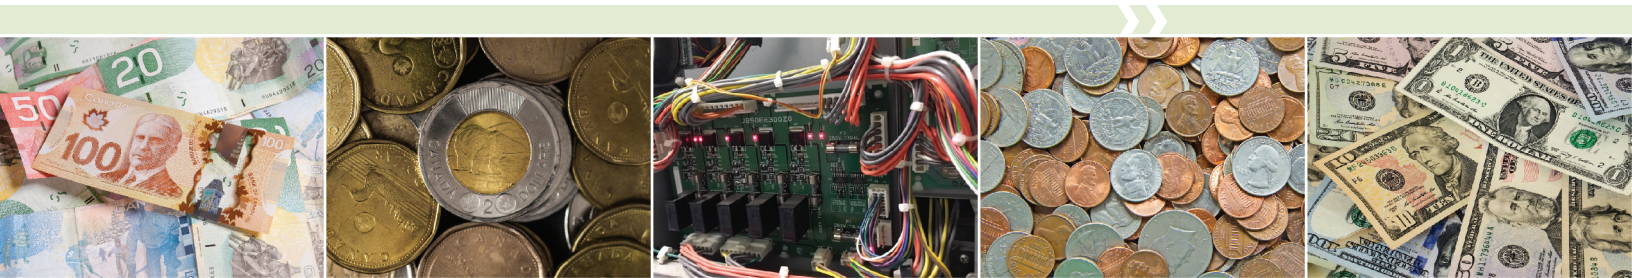

Magnetic detection can be used to authenticate US banknotes.

Ease of Use

The Infrared markings can be easily visualized for the operator using the black and white high definition imaging camera and screen. These marks can be identified and validated by way of the quick reference guide located on the top of the unit, or through the full colour visual reference card.

Durable and Portable

With its sleek design, small footprint and light weight, the C990 is easy to carry and saves space on your desk or retail counter. The unit comes enabled with an automatic sensor allowing for a power saving mode designed to prolong the lifespan of the unit.
