

Alerting Software

Protecting your business from financial and competitive risk

Advanced Business Alerts

By adding real-time advanced business alerting capabilities to all your business applications you reduce company exposure to financial risk and enhance employee performance. Why waste your day monitoring critical data when you can make it come to you?

Orbis Software and its global partner community have collaborated to deliver the drag and drop functionality you need to quickly and simply add advanced business alerting capabilities to your business applications.

The Problem:

Business applications hold a wealth of critical information yet organisations still rely on employees to manually monitor and react to data changes. This manual approach is prone to errors and is an inefficient use of employee time.

The Solution:

TaskCentre enables you to add advanced business alerting capabilities to all your business applications. This reduces your exposure to financial risk and improves company performance.

Real-time business alerts that meet your needs

Having the right information at the right time can often be the difference between success and failure. Yet despite investment in business management software organisations still rely on staff to monitor and react to data changes within business applications e.g. stock levels

TaskCentre can dynamically monitor all your applications for key data (to your business rules) and send email or SMS business alerts to both internal and external recipients when required.

Advanced business alerts

Automatically sending a business alert to an employee, customer or supplier can be of huge benefit. But what if that business alert is ignored by the recipient or the recipient needs some accompanying information to react accordingly?

TaskCentre's advanced business alerts facilitate multi-recipient, escalation capabilities and the dynamic creation and attachment of accompanying information e.g. stock level or aged debtor reports. This completely removes the need for employees to monitor business applications, eradicates risk and enhances the performance of the business.

Triggering more sophisticated business processes

Receiving a business alert can often represent the beginning of a more complex business process. For example, a business alert asking for the review of a customer credit line may result in an account manager being asked to make a telephone call to the client.

TaskCentre can automate the next step within a given process e.g. set a CRM activity for an account manager therefore enforcing best practice and reducing manual administration.
