

Connect Oracle EBS to Oracle BI in weeks, not months

Oracle E-Business Suite (EBS) is a great tool for organizations looking for a comprehensive suite of enterprise applications. Unfortunately, it's not easy to quickly analyze the data in EBS. That's why many organizations used Oracle Discoverer — and now that Oracle has discontinued support for Discoverer, reporting teams need another solution.

Oracle Business Intelligence Enterprise Edition (OBIEE) is an incredibly powerful tool for reporting. It includes interactive dashboards, operational reporting, real-time alerts, and strategy management. Combining this solution with EBS will give you an all-encompassing view of your organization.

Integrating these two tools typically requires upwards of six months, sometimes even years, to build a data warehouse, repository database (RPD), dashboards, reports, and security. AccelerateBI significantly reduces this timeline.

AccelerateBI Includes:

- Over 200 financial reports and 15 data visualization projects
- Pre-built database schema for Discoverer metadata and views
- Migration Assistant Scripts for gap analysis and discovery
- Options for data loading into the BI database instance or remote access
- Customization of pre-built model for non-EBS tables or views

AccelerateBI Analytics Views

AccelerateBI Analytics Views are designed to accommodate source-specific reporting needs and include performance enhancements for each reporting area of your organization. Each view has been developed using Oracle Database best practices and allow for automated customization through PL/SQL or related languages. Once the views have been updated to support your source system tables, our testing scripts will identify any issues within the model and highlight any errors within the syntax.

AccelerateBI Delivered Repository (.rpd)

As part of the overall delivered solution, the AccelerateBI Repository connects to the Analytics Views and easily merges with existing OBIEE repositories you may already have deployed. The repository includes a Common Enterprise Information Model which simplifies reporting for end users and is flexible enough to support your own hierarchies and metrics. In addition to the repository model, customers are provided with an optional security model which connects to the source system to limit the results based on each user's EBS role.

AccelerateBI Delivered Reports & Dashboards

The AccelerateBI Delivered Dashboards and Reports provide customers with common EBS reports to cover each of the core business areas in the model. Reports include features available in OBIEE such as master-detail and custom formatting.
