| $-\mathrm{CF}_{3}$ | -OH | 0.0013 |

## gumoumw Why are these data hard to understand?

## YUK!!!

- Too many digits
- Difficult to use consistent significant figures
- Reporting IC50 values encourages linear thinking about an exponential value
- Implies zero or negative values are possible
- Encourages arithmetic vs. geometric averaging
- Implies cutting the IC50 in half means you are doubling potency
- Encourages non-optimal experimental design

## So how can I discourage linear thinking?

Arithmetic Scale

## Start thinking logarithmically!

## CD. D.

So would a product that kills 99.99\% instead of 99.9\%

## really be only

0.09\% better?

In anti-infective circles, 99.9\% killing is usually referred to as a "3-log kill"

## O <br> DEL OZOne advanced technology for secondary disinfection

Ozone Anti-Microbial Validation under ANSI/NSF Standard 50, Annex H

Pass compliance requires a $3-\log (99.9 \%)$ reduction of Pseudomonas aeruginosa and Enterococcus faecium in 30 minutes

## Actual Microbial Reductions in 6 Minutes

| Pseudomonas aeruginosa | $6.6 \log (>99.9999 \%)$ |
| :--- | :--- |
| Enterococcus faecium | $6.7 \log (>99.9999 \%)$ |

Test Parameters

- Water temperature @70․ F
- 20 PPM oil insult
- 9 PPM Urea insult
- 1.6 PPM side-stream applied ozone dose
- Microorganism destruction was measured in the pool

| Kills: | Fold reduction | Log kill |
| :--- | :--- | :---: |
| $90 \%$ | $10 x$ | 1 |
| $99 \%$ | $100 x$ | 2 |

## Start thinking logarithmically!

You've always been doing this...

| Concentration of Hydrogen ions compared to distilled water |  | Examples |
| :---: | :---: | :---: |
| 10,000,000 | pH 0 | Battery acid |
| 1,000,000 | pH 1 | Hydrochloric acid |
| 100,000 | pH 2 | Lemon juice, vinegar |
| 10,000 | pH 3 | Grapefruit, soft drink |
| 1,000 | pH 4 | Tomato juice, acid rain |
| 100 | pH 5 | Black coffee |
| 10 | pH 6 | Urine, saliva |
| 1 | pH 7 | "Pure" water |
| 1/10 | pH 8 | Sea water |
| 1/100 | pH 9 | Baking soda, |
| 1/1,000 | pH 10 | Great Salt Lake |
| 1/10,000 | pH 11 | Ammonia solution |
| 1/100,000 | pH 12 | Soapy water |
| 1/1,000,000 | pH 13 | Bleach |
| 1/10,000,000 | pH 14 | Liquid drain cleaner |

## So you have been thinking logarithmically!

## So what is plC50 ?

Do you use IC50/EC50 and/or pIC50/pEC50 to report in vitro assay data where you work?

1. Only IC50
2. Mostly IC50, some pIC50
3. Mostly pIC50, some IC50
4. Only pIC50

- pIC50 is the negative log of the IC50 in Molar
- An IC50 of 1 uM is $10^{-6} \mathrm{M}$, which is pIC50 $=6.0$
- An IC50 of 1 nM is $10^{-9} \mathrm{M}$, which is pIC50 $=9.0$
- An IC50 of 10 nM is $10^{-8} \mathrm{M}$, which is pIC50 $=8.0$
- An IC50 of 100 nM is $10^{-7} \mathrm{M}$, which is pIC50 $=7.0$
- An IC50 of 30 nM is $3 \times 10^{-7} \mathrm{M}$, which is also $10^{-7.5} \mathrm{M}$, which is pIC50 $=7.5$

Do you see a pattern?

- pH is the negative log of the $[\mathrm{H}+]$ in M
- pIC50 is the negative log of the IC50 in M

It's not too different from what you're used to!

## Inhibitor Potency

| IC50, $\mu \mathrm{M}$ | pIC50 |
| :---: | :---: |
| 30 | 4.5 |
| $>30$ | $<4.5$ |
| 0.000682 | 9.2 |
| 1.011 | 6.0 |
| 0.99 | 6.0 |
| 0.90 | 6.0 |
| 0.8 | 6.1 |
| 0.00502 | 8.3 |
| 0.002 | 8.7 |
| 0.001 | 9.0 |
| 0.0013 | 8.9 |

pH

| $[\mathbf{H}+], \mathbf{m M}$ | $\mathbf{p H}$ |
| :---: | :---: |
| 1000 | 0 |
| 100 | 1.0 |
| 10 | 2.0 |
| 1 | 3.0 |
| 0.1 | 4.0 |
| 0.01 | 5.0 |
| 0.001 | 6.0 |
| 0.0001 | 7.0 |
| 0.00001 | 8.0 |
| 0.000001 | 9.0 |
| 0.0000001 | 10.0 |

## Other log scales you know and love...

| Richter Scale | Value | plC50 scale |
| ---: | ---: | :--- |
| Not felt by many people; no damage | 3.0 | 1 mM? <br> Only if we're doing fragment based discovery |
| Felt by all; minor breakage of objects | 4.0 | Don't bother resynthesizing |
| Some damage to weak structures | 5.0 | Are you sure??? |
| Moderate damage in populated areas | 6.0 | 1 MM? <br> It's a hit, not a lead |
| Serious damage over large areas; loss of life | $\mathbf{7 . 0}$ | OK, we're making progress |
| Severe destruction, loss of life over large areas | $\mathbf{8 . 0}$ | Getting nice potency |
| Epic destruction; | $\mathbf{9 . 0}$ | 1 nM? <br> Call J. Med Chem! |
| time to move back to Kansas |  |  |

## So, why will using pIC50 instead of IC50

will change my life?

# W pIC50 will encourage you to look at in vitro assay data logarithmically 

## THE "IC50 EQUATION": ALSO KNOWN AS THE "Four-parameter logistic", "Hill" or "Sigmoid" equation

Notice that curve fitting programs actually work with $\log$ IC50 and $\log$ [compound], and not the linear forms.

Some older software still uses this non-log form of the equation.

Don't use it!

Dose dependent inhibition is a logarithmic phenomenon, so it makes more sense to think about the data this way

## pIC50 encourages logarithmic thinking

| ID | IC50 ( $\mu \mathrm{M}$ ) | pIC50 | - The transition from $\mu \mathrm{M}$ to nM is smoother <br> - "Spacing" between IC50 values is more relevant twice as "good" as NewCo-108. |
| :---: | :---: | :---: | :---: |
| NewCo-100 | 30 | 4.5 |  |
| NewCo-101 | > 30 | $<4.5$ |  |
| NewCo-102 | 0.000682 | 9.2 |  |
| NewCo-103 | 1.011 | 6.0 |  |
| NewCo-104 | 0.99 | 6.0 |  |
| NewCo-105 | 0.90 | 6.0 |  |
| NewCo-106 | 0.8 | 6.1 |  |
| NewCo-107 | 0.00502 | 8.3 |  |
| NewCo-108 | 0.002 | 8.7 |  |
| NewCo-109 | 0.001 | 9.0 |  |
| NewCo-110 | 0.0013 | 8.9 |  |

## 咞2 <br> pIC50 will allow you to present in viltro assay data cleanly and in an easy to read form

| ID | IC50 $(\mu \mathrm{M})$ | pIC50 |
| :---: | :---: | :---: |
| NewCo-100 | 30 | 4.5 |
| NewCo-101 | $>30$ | $<4.5$ |
| NewCo-102 | 0.000682 | 9.2 |
| NewCo-103 | 1.011 | 6.0 |
| NewCo-104 | 0.99 | 6.0 |
| NewCo-105 | 0.90 | 6.0 |
| NewCo-106 | 0.8 | 6.1 |
| NewCo-107 | 0.00502 | 8.3 |
| NewCo-108 | 0.002 | 8.7 |
| NewCo-109 | 0.001 | 9.0 |
| NewCo-110 | 0.0013 | 8.9 |

- A consistent number of digits and significant figures

## COLLABORATIVE <br> Now your audience can focus on the SAR!

| R1 | R2 | plC50 |
| :---: | :---: | :---: |
| -H | -H | 4.5 |
| -OH | -H | < 4.5 |
| $-\mathrm{CF}_{3}$ | -H | 9.2 |
| $-\mathrm{CH}_{2} \mathrm{NH}_{2}$ | -H | 6.0 |
| - H | $-\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OH}$ | 6.0 |
| - H | $-\mathrm{CH}_{2} \mathrm{NH}_{2}$ | 6.0 |
| -OH | -OH | 8.3 |
| -OH | -CF3 | 8.7 |
| -OH | $-\mathrm{CH}_{2} \mathrm{NH}_{2}$ | 8.7 |
| $-\mathrm{CF}_{3}$ | $-\mathrm{CH}_{2} \mathrm{NH}_{2}$ | 9.0 |
| $-\mathrm{CF}_{3}$ | -OH | 8.9 |

Now WE'RE COMMUNICATING CLEARLY!

# \#3 <br> plC50 will make it easy and intuitive to average your in vitro assay data 

Do you average your replicate potency data (IC50/EC50 or pIC50/pEC50) using arithmetic or geometric means?

## 1. Arithmetic

2. Geometric
3. Don't know

Example Data
IC50 determination \# 1: $1 \mu \mathrm{M}$
IC50 determination \# 2: $10 \mu \mathrm{M}$

# 舞 4 <br> pIC50 and logarithmic thinking will improve how you plan your experiments 

- Do you typically set up "half-decade" dilution curves?
- The classic 1000, 500, 100, 50, 10, 5, 1 nM , etc?

- Set up "half-log" dilution curves:
- $1000,300,100,30,10,3,1 \mathrm{nM}$, etc?

Note how the points on this plot are evenly spaced, while on the previous slide are clumped.

# \# 5 <br> plC50 and logarithmic thilinking will limprove how you look at the relliability of your data 

- Standard error of the calculated value:
- the standard deviation of that parameter if you repeated the experiment many times
- 95\% Confidence Interval
- Estimate of the precision of a measurement
- If the experiment were repeated 100 times, there is a 95 percent chance that your true value will be in this range
- If a confidence interval is very wide, your data don't define that parameter very well.
- Is approximately $2 x$ the SE above and below the mean
- Modern software will report the $95 \% \mathrm{Cl}$ of an IC50, but NOT the SE.

## Analysis of the $95 \%$ confidence intervals

## The error bars are not symmetrical! What does that mean?

## Looking at the $95 \% \mathrm{CI}$ of the pIC50

## By using pIC50, your error bars are properly symmetrical, and it's easy to see which run had the "tighter" data

$\rightarrow$ HCC827
$\rightarrow$ HCC827/GR
$\rightarrow$ HCC827/ER

| $\mathrm{IC}_{50}(\mathrm{nM})$ | Gefitinib | Erlotinib |
| ---: | :---: | :---: |
| HCC 827 | $7.2 \pm 0.3$ | $15.5 \pm 9.2$ |
| $\mathrm{HCC} 827 / \mathrm{GR}$ | $>10000$ | $>10000$ |
| $\mathrm{HCC} 827 / \mathrm{ER}$ | $>10000$ | $>10000$ |

If we estimate the $95 \%$ confidence interval as $\sim 2 x$ the SE above and below the mean, does this mean the $95 \% \mathrm{Cl}$ is $\mathbf{- 2 . 9}$ to $\mathbf{3 3 . 9 \mathbf { n M } \text { ? }}$

# Summary How can using plC50 instead of IC50 can change your life? 

- Using pIC50 instead of IC50 will force/encourage you to think about your assays logarithmically
- Reviews of assay data will be easier to present (only 2 significant digits to deal with, even over a large range of potencies)
- You'll average potency properly by using simple arithmetic means of the pIC50 values - instead of Geomeans of the IC50 values
- Reliability ranges will be correct, symmetric and you will never encounter negative IC50 values!
- Using CDD Calculations, you can convert

IC50 and the IC50 Confidence Intervals to pIC50 and pIC50 Confidence Intervals

| ID | IC50 ( $\mu \mathrm{M}$ ) | $\begin{gathered} \text { MIC } \\ (\mu \mathrm{g} / \mathrm{mL}) \end{gathered}$ |
| :---: | :---: | :---: |
| NewCo-200 | 4.4 | 16 |
| NewCo-201 | $>30$ | >128 |
| NewCo-202 | 0.012 | 1 |
| NewCo-203 | 0.018 | 1 |
| NewCo-204 | 0.018 | 0.125 |
|  |  | $\downarrow$ |
| ID | pIC50 | pMIC |
| NewCo-200 | 5.4 | 5.4 |
| NewCo-201 | <4.5 | <4.4 |
| NewCo-202 | 7.9 | 6.5 |
| NewCo-203 | 7.7 | 6.7 |
| NewCo-204 | 7.7 | 7.5 |
