

HOW TO CARE FOR FROST-DAMAGED TREES

START EARLY

You can start in late winter

Because of the climate we live in, we are able to start prepping our yards sooner than other parts of the country. This allows us to get more work done on our trees and get them ready for Spring and Summer.

RISING TEMPS

Our weather is getting warmer

Our region benefits from warm weather sooner, which gets our trees ready to handle pruning, trimming, and fertilizing by the end of February/early March.

TIME TO FERTILIZE

First fertilizing of the year

February and March are the perfect time to start fertilizing your yard and adding supplements, based on your trees needs. We recommend starting with **Soil Injections** to give your tree a much-needed boost!

DON'T FORGET DECIDUOUS

This is the ideal time to trim

If you have deciduous trees in your yard, this is the best time to start pruning and cleaning them up before they produce their foliage and "leaf out" in the spring.
