

PACKETVIPER™

Rethink the Perimeter

Standard Edition Software

THE PROBLEM: TRAFFIC

Today's network security managers have come to accept the unprecedented traffic and unmanageable levels of alerts and logging as a reality of today's business climate.

While there is a proliferation of tools available today, most increase management time without sufficiently dealing with the root cause issue – the volume of illegitimate traffic.

With PacketViper Advanced IP Filtering working at the perimeter, there is a better way.

Ask about using PacketViper risk-free for 30 days

5 minutes to install, 30 days risk-free software licensing and a reduction in network traffic of at least 25%

30 Day
risk-free use!

Advanced IP Filtering Strengthens the Perimeter

PacketViper is the leading Advanced IP Filtering software that easily filters traffic, both inbound and outbound, by port, by country, company and network. Whether on premise or in the cloud, PacketViper software provides an essential layer of network security complementary to, but unlike firewalls, SIEMS or other existing solutions.

PacketViper can reduce network traffic up to 70% while both identifying and reducing threats with surgically precise, patented Advanced IP Filtering Threat Protection Software

HOW IT WORKS

PacketViper sits outside of the firewall as an undetectable in-line bridge. PacketViper provides the full context of the IP data (company, country & network) and allows you to easily perform 'point & click' traffic management and rule setting from any element of the IP. PacketViper clients have increased transparency into traffic and use that information to tailor their IP filtering to be closely aligned with the needs of the business.

REDUCE COSTS AND THREATS

PacketViper saves time and money associated with logging, alerting and dealing with illegitimate traffic. Threats are reduced and security is increased with actionable insight into the origins and destinations of all network activity.

FEATURES:

- Advanced IP Filtering at the perimeter
- Filter by company, country, network or IP
- Edge Analytics
- Bi-directional, by network, port filtering
- Actionable reporting and real-time logs
- Threat & business intelligence updates
- Multi-user, multi-gateway
- Cloud or on premise solutions

BENEFITS:

- Up to 70% reduction in network traffic
- Reduced logging and alerting
- Mitigate risks from bots and proxies
- Protection from flooding and DDoS
- Improved security performance
- Faster threat detection & improved customized threat intelligence
