Keeping Research and Development Secured from Human Error

The Problem

Given the highly sensitive nature of the R&D performed, securing their email environment from human error is a key priority for the company. The company had heard of incidents in the past where project related information had been sent to the wrong person and wanted to proactively address this step.

The management team is acutely aware of the potential risks from misaddressed emails, and had spent some time looking at various vendors before choosing to work with Tessian because of the way in which the machine learning approach solves the problem.

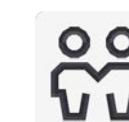

The Solution

Tessian was rolled out to 125 users across three Vernalis sites, including the UK and US. Vernalis now use Guardian and Constructor to detect and prevent email threats in the form of misaddressed emails and to implement their own custom compliance policy rules.

Tessian's machine intelligent platform has better equipped Vernalis to protect their firm from human error-related incidents over email.

“We like that Tessian is more accurate and refined than any other tool we looked at to solve the problem of misaddressed emails.”

PAUL GREANEY
Head of IT

Learn more about how Tessian prevents human error on email.

Powered by machine learning, [Tessian's Human Layer Security technology](#) understands human behavior and relationships.

 **GUARDIAN**

Automatically detects and prevents misdirected emails.

 **ENFORCER**

Automatically detects and prevents data exfiltration attempts.

 **DEFENDER**

Automatically detects and prevents spear phishing attacks.

Importantly, [Tessian's technology](#) automatically updates its understanding of human behavior and evolving relationships through continuous analysis and learning of an organization's email network. That means it gets smarter over time to keep you protected, wherever and however you work.
