

# MOVING TO CITRIX ON AZURE with DynTek

REMOTELY DEPLOY  
VIRTUALIZED  
DESKTOPS & APPS

## Leveraging the power of virtualization in the cloud

Forward looking companies are moving to Citrix virtualization solutions and the Microsoft Azure cloud to improve the efficiency and productivity of their IT environment. DynTek can help you leverage the combined power of these two technology leaders by moving your virtualized workloads into the cloud. Citrix cloud solutions are secure, fast to deploy, and easy to manage on Azure – the reliable, hyper-scalable, enterprise-grade cloud.

The alliance of Citrix and Microsoft offers multiple VDI deployments for Citrix solutions on Azure including virtual apps, desktops, data, and networking. As a certified partner of both Citrix and Microsoft, DynTek helps you take full advantage of this powerful combination.

## WHY MORE CUSTOMERS ARE MOVING TO A CITRIX ON AZURE SOLUTION EVERY DAY!

### Flexibility & Scalability

The elastic nature of Citrix is especially beneficial to businesses since workload demand is difficult to estimate. Buying and supporting servers to meet peak demand is expensive and resource draining. Running Citrix on the Azure platform allows you to dynamically scale to only pay for what you are using. Businesses planning a hardware refresh of their IT infrastructure are increasingly looking at moving Citrix to Azure to significantly decrease capital outlays and maintenance expense.

### Increased Performance

Running Citrix on Azure dramatically increases system performance. Business can take advantage of the Microsoft Content Delivery Network (CDN) to decrease latency for users of Office 365. With Citrix running on premises, users having desktops in a non-persistent fashion only get screen scrapes and mouse clicks but no cached OST. When Citrix is running in your data center, those all have to come back down from Office 365, be presented by your Citrix server, and be pushed back out to users. This causes latency as a result of having to pull down the OST the users need.

With Azure, the presentation of the mouse clicks and screen paints are all that need to traverse the network. In Azure, these presentations never leave the CDN dramatically increasing responsiveness.

## Reduced Licensing Costs

Customers who currently have on-premises Citrix can take advantage of BYOL capability by simply transferring their licensing into the IaaS in Azure without having to pay additional fees. The capability to port over their on-premises license to a cloud-based environment license eliminates the cost of additional licenses when moving to the cloud.

## THE DYNTEK ADVANTAGE

### DynTek can help you take advantage of Citrix on Azure in several ways:

We work with you to assess your current IT landscape and determine the feasibility and best approach for moving some or all of your Citrix workload to Azure. That may start with moving reporting management into Azure to take advantage of Citrix cloud-based capabilities or porting your XenDesktop environment to Azure. You may decide to move your smaller Citrix workloads into Azure including remote access that can provide immediate ROI by virtue of Azure's scalability and flexibility.

DynTek also helps you develop and maintain governance documents if you have specific compliance requirements. We can help ensure you are meeting the standards you've set up through quarterly reviews that provides status updates and possible corrective actions to ensure you remain in compliance.

DynTek services a broad spectrum of industries including enterprise and commercial, healthcare, education, finance, and government. When you are looking to map a path to Azure, DynTek has the industry and technology expertise and resources to develop and implement the solution that works best for you.

Citrix Cloud delivered on Microsoft Azure is the latest example of our collaboration with Citrix, which has always been centered on innovation and the success of our mutual customers and partners. Together, we defined the virtual desktop category and now we are collaborating on new Citrix services on Azure, which will do the same for the cloud.
