

As a business that runs on IBM i, you may wonder what the future looks like for the platform and your enterprise applications. Cloud enablement, integration with other business systems, and implementation of new technologies, like AI, may seem out of reach. Fortunately, that's not the case.

Profound API is a solution to deliver the connected, portable, and cloud-ready applications your business needs. We harness the power of Node.js to work natively with your IBM i, opening application possibilities that were impossible until now.

With Profound API, you will have access to the fastest and easiest way to generate REST API on IBM i, as opposed to writing web services in RPG. This enables you to:

Easily and properly integrate IBM i with other non-IBM i systems, like Salesforce, Watson, and Amazon, to name a few

Build API the correct and modern way by avoiding "screen scraping" API solutions that will only add to your company's technical debt

Ensure both application scalability and durability

Confidently execute on a strategy to take your business applications to the cloud

“ Thanks to Profound API, our applications are now incredibly seamless, flexible, and dynamic. Since rolling out our Node.js apps, we have significantly improved the business's perception about the IBM i platform.”

Trevor McCullough, Kamik/Genfoot, Inc.

“ Profound Logic provided an excellent solution for rapid modernization, web services, and Node.js applications. We were able to deliver a complete business package much easier, faster, and more affordably than we thought possible.”

Barnabas Muthu, Ryder Last Mile
