

# RTI DDS Toolkit for LabVIEW

Fast, scalable and interoperable publish/subscribe messaging

RTI<sup>®</sup> DDS Toolkit for LabVIEW allows you to reliably share data across highly distributed and heterogeneous systems. Built on RTI Connex<sup>™</sup> DDS, the market-leading implementation of the open standard Data Distribution Service for Real-Time Systems (DDS), the RTI toolkit enables seamless data exchange between LabVIEW and other DDS compliant applications. By providing an off-the-shelf and interoperable alternative to custom communication solutions, the RTI toolkit significantly reduces your development, integration and maintenance costs.

## Standard Features:

Scales to thousands of nodes and millions of data points

Extremely low latency and high throughput

Reliable multicast for efficient data distribution

Decentralized architecture with no services or brokers required

Seamless communication over shared memory, LAN, WAN and Internet

Core technology proven by 650+ customers

Support at [community.rti.com](http://community.rti.com)

## Optional Features:

Secure communication with TLS/SSL and DTLS

SDKs for C, C++, C#/ .NET, Java and Ada, including on CompactRIO systems

Adapters for integrating existing apps

Real-time data recording and replay

Integration with RDBMS and Microsoft Excel

Tools for distributed system debugging

Phone, email and web access to RTI Support

RTI DDS Toolkit for LabVIEW helps you overcome several distributed system challenges:

- Reliably publish data to many subscribers, including streaming data
- Deliver low latency and high throughput while scaling to large systems
- Easily integrate LabVIEW with other applications

The RTI toolkit provides a set of subVIs for publishing and subscribing to data. They allow you to easily exchange data between LabVIEW VIs and other applications that use DDS.

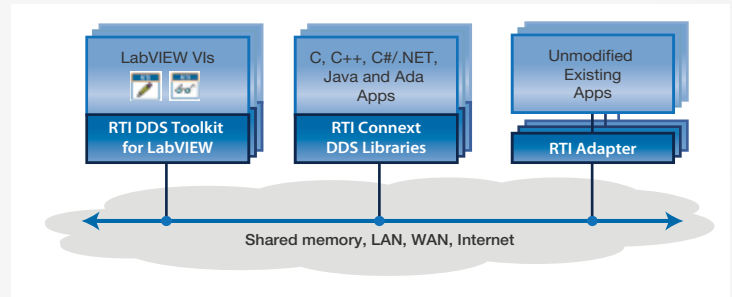

The RTI DDS Toolkits for LabVIEW and LabVIEW Real-Time are available from the LabVIEW Tools Network and can be installed directly from the VI Package Manager. There is no charge for the RTI DDS Toolkit on Windows. Contact RTI for pricing and availability on other platforms.

## Rich Ecosystem

RTI DDS Toolkit for LabVIEW works seamlessly with the RTI Connex product line. Capabilities include:

- Connex DDS libraries and SDK for all major programming languages, operating systems and CPU families, including CompactRIO
- Real-time data recording for later analysis and debugging
- Replay of recorded data for testing and simulation
- Bi-directional Microsoft Excel integration
- Routing between networks and security domains
- Adapters and adapter SDK for easy integration with other protocols and unmodified existing applications
- Transports for secure networking and for low-bandwidth networks such as satellite and radio
- Bi-directional database integration for data sharing between SQL and DDS applications
- Tools to visualize, monitor and administer a distributed system
- REST/HTTP interface for web applications and scripting

## Optimized for Mission-Critical Real-Time Systems

The RTI DDS Toolkit for LabVIEW employs a completely decentralized architecture. It does not require any servers, services or message brokers. The messaging infrastructure is completely embedded in the RTI subVIs, which communicate peer-to-peer. This delivers:

- Minimum latency because there is no intermediate software or gratuitous network hops
- Maximum throughput and scalability because there is no service acting as a bottleneck or choke point
- Non-stop availability because there is no single point of failure
- Easy embedding because there are no services that must be started and administered

Automatic discovery eliminates the need for deployment-time configuration. Applications are plug-and-play, facilitating use in dynamic networks. The DDS middleware automatically discovers and routes data between matching publishers and subscribers at runtime; systems are self-forming and self-healing.

Multicast support provides very scalable one-to-many and many-to-many data distribution. Messages only have to be sent over the network once, regardless of the number of subscribers. The network switch automatically routes data to all subscribing nodes. This maintains low latency even for very broad data distribution. Since network-level multicast is unreliable, DDS includes an optional reliability protocol optimized for real-time behavior.

Fine-grained control over messaging Quality of Service (QoS) allows you to optimize tradeoffs between latency, throughput, CPU overhead and network overhead. The frequency, timeliness and reliability of data delivery are configurable per-stream and per-application. This eases integration of applications with disparate performance needs, such as real-time and IT applications.

### About RTI

RTI provides the connectivity platform for the Industrial Internet of Things.

Our RTI Connex<sup>®</sup> messaging software forms the core nervous system for smart, distributed applications. RTI Connex allows devices to intelligently share information and work together as one integrated system. RTI was named "The Most influential Industrial Internet of Things Company" in 2014 by Appinions and published in Forbes.

Our customers span the breadth of the Internet of Things, including medical, energy, mining, air traffic control, trading, automotive, unmanned systems, industrial SCADA, naval systems, air and missile defense, ground stations, and science. The total value of system designs that trust RTI for their fundamental architecture exceeds \$1 trillion.

RTI is committed to open standards, open community source and open architecture. RTI provides the leading implementation of the Object Management Group (OMG) Data Distribution Service (DDS) standard.

RTI is the world's largest embedded middleware provider, privately held and headquartered in Sunnyvale, California.

Your systems. Working as one.
