Mobile Biometric Authentication
For Secure Application Access

—

Strengthen trust and security for your enterprise and client
applications using biometric multi-factor authentication.

Mobile Biometric Authentication

Whether it's for internal networks or client security, mobile biometrics can provide organizations with exact identity assurance of who is accessing secure applications or approving high-risk transactions.

With the BioConnect Mobile Authentication App, your enterprise can send risk-based step-up requests complete with a full audit log of all transactions and access attempts of users provided, creating a layered defense against unauthorized or suspicious access.

Security for Applications

—

Biometric access control can be implemented at any level of the enterprise. With BioConnect's solution for mobile applications, you can easily secure your enterprise network across the entire organization. Users will be unable to share their passwords, leaving the enterprise vulnerable to attacks. Each biometric identity is associated with a device so users must be present and engaged in all access attempts and can no longer pass along authorization to secure data.

How it Works

The BioConnect approach to deploying mobile biometric authentication in the enterprise is comprised of two technological components:
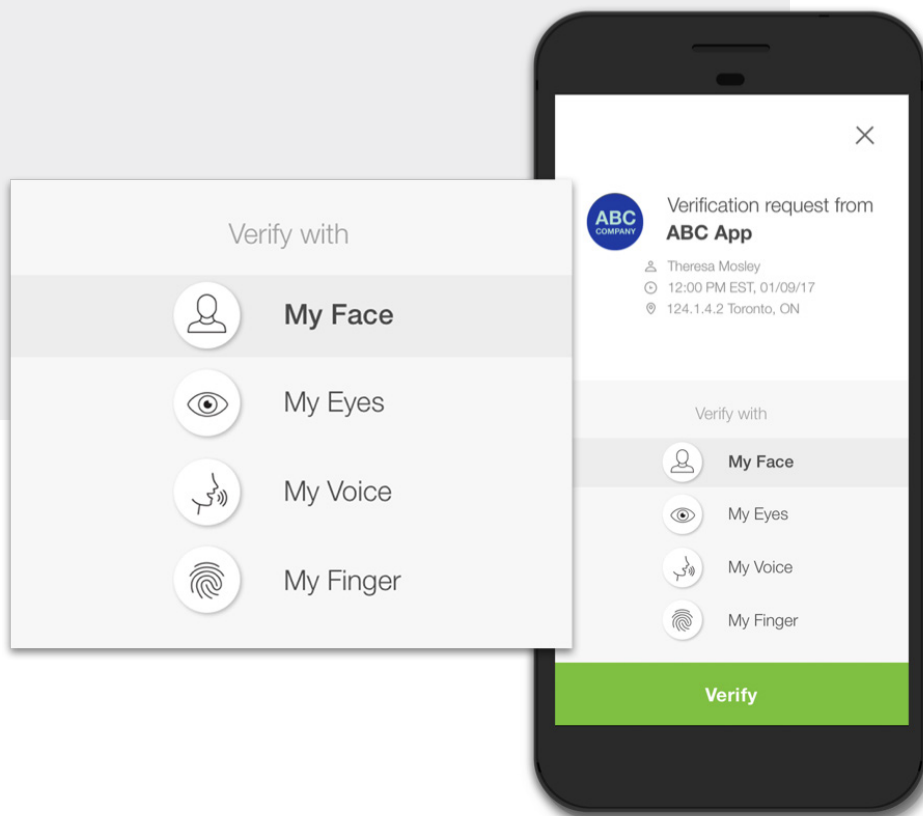

1 **For users:** BioConnect's Mobile Biometric Authentication app*. Available across all IOS and Android smartphones for assuring secure identity authentication with added convenience.

2 **For administrators:** Admin Console is an easy to use reporting dashboard that collects real-time data about employee access events.

Together these components form a comprehensive security strategy that can easily be adopted into your enterprise's current security infrastructure.

Mobile Biometric Authenticator

Allows for step-up biometric authentication that is easy and convenient for the user. Whether it's downloading sensitive files or completing high-risk business transactions, trusted connections require knowing who is on the other side. The mobile app allows for single or multifactor authentication while offering immediate detection of malicious activity, geographic and time anomalies, and provides actionable incident management.

Admin Console

The Admin Console leverages all information and data from authentications to make managing access points simpler. The Console provides valuable insights while giving administrators total control over user and device cycles. Making a single or multiple modality method for authentication based on access risk levels has never been easier. The Admin Console also provides an extensive audit log, so unusual activity can be noticed and reported. All transactions and access event are recorded used to inform future decisions for improving security protocols.
