

Smart BSP Analysis

BSP Testing Challenge

Changes to BSP apps can affect key business processes such as order-to-cash.

Testing everything is impractical and accepted to be inefficient and ineffective.

So how can we maintain development velocity and still achieve zero production defects?

User Interface Impact Analysis

LiveCompare's unique smart impact analysis identifies the most-at-risk BSP applications to test in response to all SAP application changes (standard and custom).

LiveCompare identifies the specific BSP application views that should be exercised to validate changes.

Understand the impact on screens/views and drill down to side-by-side comparisons of changing repository and data dictionary objects.

Smart BSP Comparison

Run side-by-side comparison of BSP and BSP extension object types.

Smart attribute filters eliminate immaterial changes (fully configurable).

Analyze BSP apps fast to eliminate risk to production and achieve zero defects when you go-live.
