

LiveInterface

Enterprise Application Integration

Reduce the time, expense and risk of SAP interface and data migrations with LiveInterface™ - the specialist SAP-centric Integrated Development Environment (IDE) for creating and managing durable, enterprise-class, two-way interfaces to SAP applications. Rather than writing custom code which will be costly, time-consuming and difficult to maintain, LiveInterface lets you create stable interfaces in a fraction of the time.

The Interface Challenge

For SAP developers and IT professionals, there are limited options when it comes to enterprise data integration. You need your SAP system to communicate on an ongoing basis with legacy applications, process-control systems, partner databases and much more. Those interfaces need to extract, convert, transmit and manage data to and from a multitude of sources and targets. Developers are constantly challenged with developing multiple interfaces, quickly, with very few skilled, and often scarce resources. Once developed, these interfaces need to be tested, optimized and monitored on a regular basis to ensure data integrity.

How Does LiveInterface Help?

Written entirely in native SAP ABAP, LiveInterface for SAP applications is a complete data management environment that automates the construction and management of SAP interfaces. Using Wizard-based 4GL technology, developers of all skill levels can create standard, maintainable interface code in a fraction of the time previously required.

LiveInterface continues to provide value throughout the operational lifecycle of the interfaces through built-in monitoring and alerting features. LiveInterface components will automatically be provided a detailed audit trail; recording of the data received and sent, alerts to

- ✓ **SAP-Certified ABAP Add-on**
- ✓ **Compatible with all ABAP SAP applications, including Industry Solutions**
- ✓ **Unicode support**
- ✓ **Point-and-Click Wizards let you build structured, optimized ABAP interfaces automatically**
- ✓ **Lower costs through faster interface development**

support personnel for significant events, and recovery/restart facilities for all interfaces, no matter what data delivery method is used, without reposting that data which had been successfully processed.

Support All Your Interface Needs

LiveInterface handles all of the SAP database navigation and data input/output operations for you automatically so you'll be building interfaces in minutes! Simply identify the data elements, provide the basic business logic, and LiveInterface handles all of the infrastructure work.

LiveInterface generates tight, syntax-error-free, pre-tested ABAP code that is optimized for maximum processing efficiency and guarantees data integrity. All LiveInterface interfaces that you create inherit the advanced monitoring, runtime management, alerting and drill-down analyses for quick and easy error correction.

LiveInterface provides simple handling of data export and conversion operations for use in 3rd party applications.

LiveInterface provides a complete audit trail with adjustable logging and saved-data details. The LiveInterface "Snap Shot" provides a central monitoring point of management for SAP data movement, providing recovery and rollback when needed. Go deeper with the "Healthbench" and see a particular interface's status and drill down to quickly identify and recover from any errors. Send alerts detailing more than 500 conditions to e-mail, pager, phone or fax.
