

Hewlett Packard Enterprise Quality Center and LiveModel

LiveModel allows organizations to transform the way in which they manage test scripts

With pressure on resources and tight timeframes, IT departments have limited time to create and maintain test scripts. Incomplete or out-of-date business process documentation causes problems. Tests available in HPE Quality Center decrease in value if they don't reflect actual SAP® system use.

Benefits of the solution and HPE integration

The integration of LiveModel with HPE Quality Center provides organizations running SAP a unique solution for managing and testing change. The integration increases agility, helping companies respond to business change faster, with less cost and less risk.

LiveModel is a web-based application, connecting to both HPE Quality Center and SAP to automatically discover business processes, turn these into business process test requirements and build test plans. This integration saves time and ensures that test plans match the business processes.

LiveModel synchronizes changes between SAP and HPE Quality Center. LiveModel tracks content it sends to HPE Quality Center and automatically updates projects when changes from LiveModel are applied. This ensures organizations implement what they design and test what they implement.

Solution benefits

- Reduce time, effort and resources when creating and maintaining requirements and test plans
- Automate SAP business process discovery and validation
- Synchronize change between HPE Quality Center and SAP automatically
- Free up time to develop further tests to increase overall SAP testing coverage
- Improve testing quality and reduce risk to the business
