

Secure Networking Platforms

The genie is out of the bottle.

*Massive Firewall and Routing Throughput.
Orchestration Management. Collapsed Cost.*

*All through open-sourced based software on
commodity hardware.*

The open source secure networking company.

The world of IT networking and security are going through a transformation.

The market is changing:

- Software is eating the world
- IT is moving to the cloud
- IoT device count is exploding
- Robots and APIs enable 'turn-on-a-dime' infrastructure management
- Security is moving to the edges
- Networking is becoming a virtual utility

'While firewall and routing feature functionality is mature, high-performance delivery and manageability is due for wholesale change.'

Secure network complexity and costs "disappear". User and application demands are met instantly, like power or water:

- Massive bandwidth
- Exactly when and where needed
- Fast to provision
- Inexpensive to delivery
- Effectively secured

But, network boundaries will remain. Whether physical or virtual. And where there are boundaries – firewall, VPN, and routing functionality will still be required.

While firewall and routing features are mature, throughput and manageability are due for wholesale change.

Netgate addresses the three pillars of secure networking as a utility:

- Massive firewall & routing scalability
- Instantaneous network adaptation
- Collapsed capital and operating costs

Netgate's open source-based secure networking platforms provide the utility

freedom today's business, government, and educational institutions need:

- Freedom to scale. No more kernel-based performance limitations.
- Freedom to handle any application need. No nagging packet size or encryption limits.
- Freedom to automate manageability. API ready for orchestration management solutions.
- Freedom to slash CapEx and OpEx. No more vendor lock-in h/w, or hidden s/w fees.

'Netgate's open source-based secure networking platforms provide the utility freedom today's businesses, government agencies, and educational institutions need.'

Freedom to focus on your business. Secure networking is now a utility. Productized, tested and supported by Netgate.

The IT world is changing. Netgate's open-source based secure networking platforms enable the future to happen now.

Ultra High Performance Secure Networking
Enterprise and Carrier Class traffic throughput and orchestration management

- The full power of next gen firewall and routing functionality with greater scalability, orchestration management
- Integrated enterprise-class support available 24x7x365
- Fraction of the cost of expensive, proprietary alternatives
- Ideal for the ultra-high performance and sophisticated management needs of large enterprises and service providers

High Performance Secure Networking
SMB to Mid-Enterprise traffic throughput with orchestration or Web GUI management

- Leverages the technology advancements inherent to TNSR
- Adapted to reduced throughput needs, and support for a variety of OS's
- Ideal for SOHO users, businesses, government and educational institutions needing the assurance of a commercially-supported solution at a fraction of the cost of proprietary alternatives

Entry Performance Secure Networking
SOHO to SMB entry-level performance and manageability

- World's leading open-source firewall, VPN, router solution
- Over 1 million active global installations
- Free premises use for consumers and small businesses looking for entry level security features
