

Automated Scan to ERP

Simplifying access to critical information

Situation

The administrators of a mid-size company need to scan invoices, orders & other related documents into their ERP system. They are using a standard workflow or scanning to themselves at each workstation. This often slows down their business due to the abundance of paperwork to scan. They've tried generic 3rd party software, but the productivity did not improve dramatically because the user interface at the MFP was not fast enough & still required multiple manual steps to complete the workflow.

Solution

A Foxway customized cloud application connecting any number of MFPs to the end-customer's ERP system. Solutions are developed to seamlessly integrate into systems like Sage, Navision, SAP and other ERP systems. The output can be a basic searchable PDF file direct from the application or a processed file with PDF, searchable text file and mapped XML info. The end-customer will have a customized interface directly on the device to process their everyday work. The solution can also include user information, log files and other relevant data following the workflow management.

Getting Started

Ask the end-customer how they perform their invoice scanning processes today?
Understand their current technology infrastructure to support invoices
Suggest a project where you can customize the MFP to their needs and workflow
Decide how you prefer to monetize and implement the solution

Technology Required

ConnectKey MFP

Foxway Scan to ERP Solutions Hosted in the Cloud

Analyst support to integrate with customers DB or ERP system and/or access to Connect Key optimized middleware.
