

CheckAED™ Mobile App

Available on Google Play and in the App Store

Maintaining AEDs

AEDs, while easy to use, require ongoing management and inspections to make certain they are ready when needed. A company with multiple AEDs may find that maintaining the devices can be time consuming and difficult to manage.

Now with QR Code Scanning

AED program management customers who download the CheckAED mobile app on their iPhone or Android to record the routine inspection from their web-enabled mobile device just got easier.

With just one touch you are presented a list of your AEDs but what if you manage 10, 20 or 100 AEDs? How do you quickly navigate to the one you are standing in front of at that time? Now, it is simple.

Print and Scan

Within your AED program management dashboard you can now print your own QR Code for each of the AEDs in your account. Simply attached your QR Code to the existing AED, cabinet or carry case. Then use the scan feature within the CheckAED mobile app from the inspection page to scan the QR code with your iOS or Android device. The AED with the matching serial number will be brought up within the app for easy inspection.

Contact us and discover how CheckAED provides the peace of mind that comes with knowing your organization is fully prepared to battle sudden cardiac arrest.
