

MOBILE APP DEVELOPMENT COSTS

Essential to the mobile app creation is its development cost that depends on a lot of factors

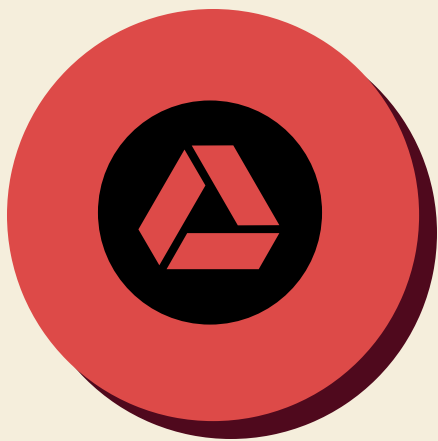

PLATFORMS TO TARGET

The cost of building an app depends on the platforms you target. The more platforms you wish to support, the more the app development would cost.

SCOPING AND DEVELOPMENT MODEL

The cost for development would be affected by the type of model you use, the waterfall model or the agile method. Both are vastly different development models that determine the cost.

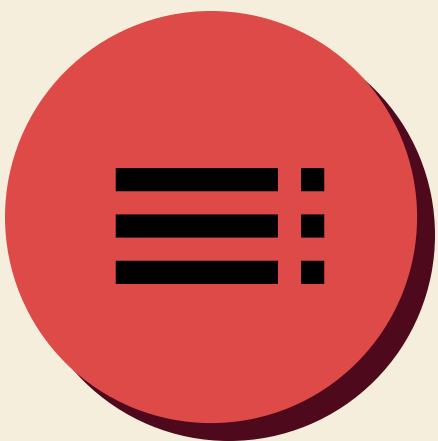

DESIGN

App design is what separates a good app from an amazing app. An average design would cost less compared to an app with an impressive design.

APP FEATURES

The most important and the most dynamic of the pricing factors is the app features. As the number and complexity of the features increases, so does the development cost.

INFRASTRUCTURE

If the app is not a standalone offline app and has a server component involved, the cost increases.
