

Device Server Configuration (Windows)

This document explains how to configure the IP address to the device server using the Device Server Setup. Follow the instructions below to configure the device server.

1 Double-click **Dssetup.exe** contained in the **Device Server Setup** you have downloaded.

*If the **User Account Control** message is displayed, click **Yes** or **Continue**.

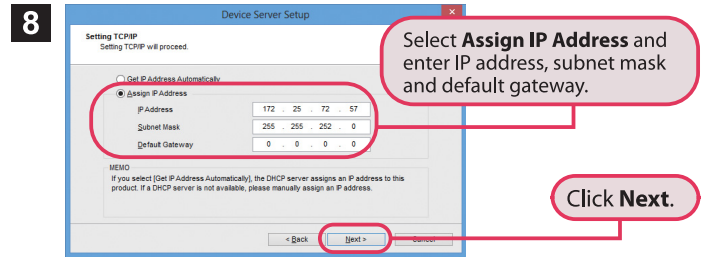

Note

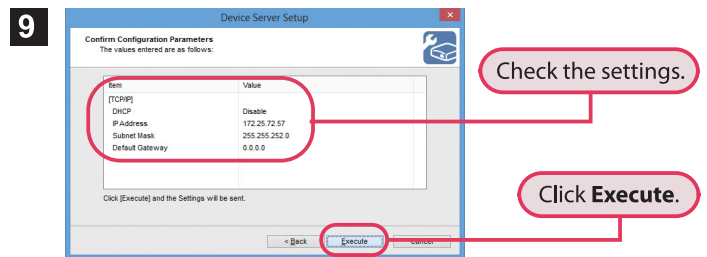

If an IP address other than 0.0.0.0 is displayed in the list, it is possible to use the address automatically obtained from a DHCP server.

- If you wish to use the obtained address, you do not have to configure the following settings. Click **Cancel** and go on to install the application. (Please see the **SX Virtual Link Installation** guide.)

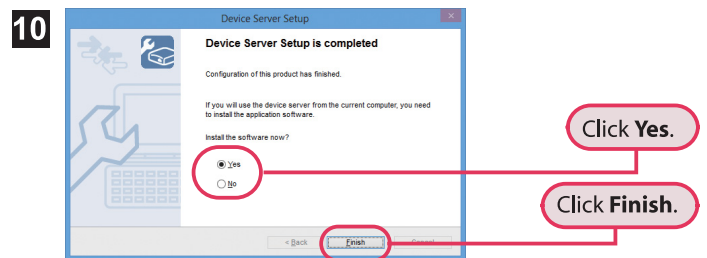

- If you wish to configure the IP address manually, continue to "8".

* When the window without the option, "Get IP Address Automatically" is displayed, please enter the IP address (mandatory), subnet mask and default gateway.

* The settings displayed here will vary depending on the configuration you made.

* Select **No** when you do not want to install SX Virtual Link.
