AkitaBox

Full Stack Developer

About Us:

AkitaBox is a rapidly growing company of about 40 people, headquartered in downtown Madison, WI. We were founded in August of 2015 by a nuclear engineer, a building technology guru and a lifelong salesman who had a vision to advance the built environment to improve the lives of others. Our software-as-a-service product helps building managers and operators automate their manual maintenance processes, saving them time, money, and likely a few choice words. With our ridiculously easy to use software interface, phenomenal customer success and efficient implementation; our product is selling faster than a newly launched Tesla. If you're looking for a startup company that values transparency, empathy, personal AND professional growth, but still knows how to have some fun - we're the company for you. We're disrupting the world's largest market - the world you and we live in. Our team is expanding rapidly, and we want you to help us continue our growth.

What we'll do for you:

We practice the golden rule - we treat you as you want to be treated. We only hire people we trust (seriously it's written in our core values), so from day one, you'll be treated as an expert with valid opinions. You'll work with us, not for us. We want to help you achieve your goals, while you help us achieve ours. We have a relaxed and flexible small business work environment with tons of opportunity for growth and upward mobility. We've also got you covered with full health benefits, vacation, and paid holidays. In short, we let you be… well... You!

Who you are:

You're looking for a place where you can work on a product that is changing the world, with a fantastic culture to boot. You feel most productive when you're contributing value to a product, team or society. Results matter to you, and you need a culture where effort is rewarded. You're innately curious with a veracious appetite for learning and growing. You don't mind socializing occasionally, and feel comfortable discussing your ideas with those around you. You'll fit in with our team if you enjoy a good chuckle, silly office trophies, delicious treats, and you're quick with a gif.

What you'll do:

As a Full Stack Developer with Akitabox, you'll develop new features and iterate on existing features, perfecting your mastery of the MEAN stack. You'll help to implement scalable, secure, low-latency and highly available cloud applications and APIs while helping to define architectures and design patterns. We have a gregarious group of ten developers who will work with you to write maintainable, reusable, testable and efficient code. You'll also participate in code reviews, standups and all the other great parts of the Agile process.

Your qualifications:

You must have one to three years of experience in a professional development setting with strong proficiency working with JavaScript, Node.js, Express, MongoDB, frontend frameworks (we use Angular), HTML and CSS. You've also taken a leading role in building scalable cloud applications and APIs that have been successfully delivered to customers. You have a thorough understanding of code versioning tools, such as Git. Technical skills are important, but we value a cultural fit above all else. So, you must enjoy working in a fast paced (but fun!) environment, and have a strong work ethic.

How to apply:

If you like what you see here, please apply using the form on our Careers page. A real human (me, Clara Buenzow) will review your information and get back to you if we think you're a great fit.
