

How can caffeine affect my sleep?

Caffeine is a drug that acts as a stimulant, both mentally and physically. It is found in many drinks and foods that are common in our everyday life. These include tea, coffee, chocolate and cola drinks. Many people do not think of it as a drug. It can be bad for your sleep in three ways. Firstly it can make it harder to go to sleep. Secondly it can make you sleep more lightly and wake up more often during the night. Thirdly, it may make you have to get up to go to the toilet during the night.

Some people need more caffeine than others to have the same effect. As a rule, caffeine takes about an hour to reach peak levels in your body. Its effects can last from four to six hours, but your body needs about 24 hours to completely eliminate it. Many people who consume a lot of caffeine think that it no longer stops them from being able to go to sleep, because they have become immune to this effect. However research shows that, even if they think otherwise, their sleep is impaired and they would sleep much better if they abstained from it.

How much caffeine is in common foods and drinks?

The amount of caffeine in a drink will vary with its strength. The table below shows the amount of caffeine in the most common sources. Note that normal tea has a lot more caffeine than many people think.

Important Things to Know About Caffeine, Food, Alcohol, Smoking and Sleep

- You should limit the amount of caffeine you eat or drink and avoid it for at least 4 hours before going to sleep.
- Caffeine may make it difficult to fall asleep and may also cause you to sleep more lightly.
- A healthy, balanced diet will improve your energy levels and sleep. Having meals at the same times each day will help keep your body clock stable.
- You should allow 2-3 hours between the last main meal of the day and going to bed. A small bedtime snack is fine.
- Avoid alcohol for at least 4 hours before going to bed. It will disrupt your sleep during the night.
- Nicotine is a stimulant that may make it more difficult to go to sleep and to stay asleep.

SUBSTANCE	CAFFEINE CONTENT (milligrams)
COFFEE (250ml or 1 small to average sized cup)	<i>Depends on brand and strength</i>
Instant coffee	65-100 mg
Brewed coffee	80-350mg
Iced coffee	Up to 150mg per carton
Decaffeinated coffee	2-4mg
TEA (250ml or 1 small to average sized cup)	
Herbal tea	0-30 mg
Green tea	30-50 mg
Normal tea	50-70 mg
SOFT DRINKS (375ml can or a medium sized cup)	
Coca-Cola , Pepsi or similar	50 mg
Red Bull (250ml)	80 mg
V	80 mg
Mother	150 mg

SUBSTANCE	CAFFEINE CONTENT (milligrams)
CHOCOLATE	
Most chocolate bars (<i>dark chocolate has more caffeine</i>)	20-60mg per 200mg serve
Cocoa and hot chocolate	10-70mg per cup
CAFFEINE TABLETS	
NoDoz (Regular strength, per tablet)	100 mg

How much caffeine should I have?

If you are having trouble sleeping, you should try to limit the amount of caffeine that you have. It is best to have no more than 200mg per day. You should not have any for at least 4 hours prior to bedtime. Many people will find that their sleep improves with just this change. But you should also keep in mind that caffeine is addictive. This means that if you stop suddenly, you may suffer from headaches, tiredness and anxiety. In this case, gradually cutting down may be better.

How can food affect my sleep?

Both what you eat in your meals and when you eat them can affect your sleep. As a rule, a healthy, balanced diet will be good for your overall health and well-being. You will have more energy during the day and sleep better at night. It is best if you allow 2-3 hours between having your last main meal of the day and going to bed. You should not go to bed hungry, nor just after you have had a meal. If you have a long time between dinner and bed, you may find that eating a small, light snack (e.g. a piece of fruit) or having a milk drink prior to going to bed helps you to sleep better. Some people find that rich or spicy foods in the evening make it more difficult to sleep well at night.

Will alcohol help my sleep?

Although alcohol will make you feel sleepy and may help you fall asleep at night, it actually disrupts your sleep later. In the second half of the night, sleep after drinking alcohol is associated with more frequent awakenings, night sweats, nightmares, headaches and is much less restful. It is best to avoid alcohol for at least 4 hours before bedtime. Binge drinking will affect your levels of melatonin for up to a week. [Melatonin](#) makes us feel sleepy at night, helps us to sleep better and regulates our [body rhythm](#).

Will a cigarette help my sleep?

You may think that having a cigarette before bed or in the middle of the night relaxes you, but this is not the case. Nicotine is a stimulant and makes it harder to fall asleep and to stay asleep. Cigarettes should ideally be avoided altogether, and certainly for at least 2 hours before bed.
