ISO 27001 Management Services

Cyber security made simple.

What is ISO 27001?

ISO 27001 is an international standard that provides the best practice policies and procedures for keeping an organisation's IT assets secure. This independent certification of an organisation's information security management system helps to unify security processes into one management platform. It identifies issues that could put a company's data at risk, and creates the processes and procedures to proactively prevent further problems occurring.

How can ISO 27001 help your business?

ISO 27001 is now one of the most widely-used security standards, with certifications growing by 450% over the past decade. But what are the competitive advantages your business can gain by achieving and maintaining this level of compliance?

Win New Business

Clients are rightly becoming ever-more demanding with regards to data security. By implementing ISO 27001, you're ensuring you can meet these demands.

Meet Legal Requirements

ISO 27001 compliance provides the foundations for a series of other key cybersecurity and laws and protocols such as PCI DSS and the EU GDPR initiative.

Reduce Information Security Costs

The thorough audit of your information security management system undertaken as part of the ISO 27001 process reduces the need for unnecessary layers of costly defensive technology.

Stamp Of Approval

Achieving the ISO 27001 standard cements your position as a business that takes its security seriously; a physical stamp of approval that you can use to reassure existing and potential clients you'll keep their data safe.

Why Abilott should be your ISO 27001 partner

Our Experience

Abilott's expert team of lead auditors help businesses of all sizes achieve ISO 27001 without the fuss. We have worked with organisations from sectors as diverse as financial services, gambling and retail, guiding them through the entire process from assessing their current state of readiness to achieving the full ISO 27001 standard.

Six Stage Process

Our tried and tested six-stage methodology can significantly reduce the length of a typical project, regularly achieving compliance in as little as three months as opposed to the usual nine.

1 Assess company awareness and define the scope of ISO 27001 related estate.

2 Operational awareness and policy process review.

3 Compliance testing, GAP management and technical delivery.

4 Independent audit and review against complimentary standards.

5 Training, audit preparation and evidence gathering.

6 Achieve compliance and embed ISO 27001 into BAU.
