UpGuard CyberRisk

The Cyber Resilience Platform
Businesses depend on trust, but breaches and outages erode that trust. UpGuard is the world's first cyber resilience platform, providing visibility into third party risks to streamline vendor management and avoid data breaches.

Capabilities Overview

Comprehensive, Accurate Data
CyberRisk gathers data on every organization's digital footprint non-invasively, requiring no software installation or participation from the assessed vendors. UpGuard prides itself on the accuracy of our data and only uses methods that scale from the smallest SMB to the largest enterprise, avoiding false positives due to brittle methods like IP attribution. UpGuard performs its cloudscanner assessments every day, scanning more entities and scanning them more frequently than competitors.

Automated Assessment Questionnaire
While the cloudscanner can detect many leading indicators of breach, vendor risk programs still require attestations on controls that aren't publicly accessible. UpGuard offers integrated security questionnaires to automate the most time-consuming part of vendor risk assessment. Often, the time cost of manging assessment questionnaires means that only a sample can be closely examined. CyberRisk automates the document lifecycle and analysis to increase the number of managed assessments by tenfold.

Security Ratings
UpGuard simplifies vendor risk management by processing every organization's security hygiene factors into a single score indicating the overall cyber risk of every business entity larger or small, from parent holding companies to subsidiaries to their websites and APIs. Every input to the score is available to users of the platform, allowing easy hand-offs to implementers to begin remediation. Businesses that take the findings seriously often see significant improvements in their score within a week.

Data Breach Disclosure
Cloud leaks and misconfigurations have exposed private information of millions of people and the administrative credentials of enterprises' most sensitive systems. UpGuard's Cyber Risk team constantly works to seek out and secure exposed data to protect both the businesses and the individuals at risk. As part of using CyberRisk, you may elect to have the research team inform you of exposures related to your business through our responsible disclosure program.
