MICHIGAN'S CONSTRUCTION INDUSTRY: BY THE NUMBERS

COMMERCIAL: 33%
INFRASTRUCTURE: 17%
RESIDENTIAL: 40%
INDUSTRIAL: 10%

SEPTEMBER 2017
In July 2017, the State of Michigan announced that the unemployment rate hit a 17-year low of 3.8 percent. This news, however, was tempered by another statistic that was not good news. According to the Michigan Bureau of Labor Market Information and Strategic Initiatives (LMISI), the overall labor force — those able and actively seeking work — dropped for a second consecutive month. This means the unemployment rate dropped because fewer people are looking for work, let alone careers.

This trend was highlighted in a report by the Michigan League for Public Policy issued in early September 2017, showing that not only is Michigan’s labor force shrinking, but that more and more young people are choosing to not enter the workforce at all.

A disenfranchised generation is yet another alarming reality to face when trying to supply the demand for the best and brightest to work in Michigan’s construction industry.

On the demand side of construction labor: often when industry members are talking, the topic of conversation is the lack of workers. The bench of talented workers is empty. The pipeline to more workers is broken. Construction employers are desperate for workers today and are concerned about finding them in the future. Contractors are saying no to customers because there are no workers to do additional work.

On the supply side, many people working today are classified as underemployed, meaning they are working in jobs or for pay far below what their experience or qualifications warrant. There are others who seem so uninspired, disconnected, and in debt that they don’t even know how or where to start. Employers of traditionally blue-collar workers are finding it increasingly difficult to find people who have any skills or qualification, the willingness to work hard, and the ability to pass a drug test.
SOMETHING IS NOT RIGHT. THERE MUST BE A BETTER WAY.
The mission of the Michigan Construction Foundation is to help more people across our state get good paying jobs in Michigan’s construction industry. In so doing, construction employers get a bigger and better-qualified pool from which to choose the best candidates to get the work done.

We at Michigan Construction thought now is a good time to share information on Michigan’s construction industry. This information we gathered and analyzed sets a benchmark to begin seriously addressing Michigan’s construction talent supply gap.

THIS REPORT LAYS THE GROUNDWORK BY EXAMINING FOUR ASPECTS OF MICHIGAN CONSTRUCTION INDUSTRY LABOR DATA:

1. Organizing the industry into four subsectors and five occupational categories.
2. A breakdown of Michigan’s construction labor force.
3. A look back at construction’s lost decade.
4. An overview of the construction trades workforce.
ORGANIZING
THE INDUSTRY
INTO FOUR SUBSECTORS AND FIVE
OCCUPATIONAL CATEGORIES

To make it easier to navigate the complex landscape of the construction industry and establish the full spectrum of opportunities throughout the entire construction supply chain, Michigan Construction organized the industry into four main subsectors and construction occupations into five main categories.
The construction industry’s four subsectors each have different owner types, contractual requirements, licensing, regulations, scopes of work, and data sets kept by various government agencies and industry interests:

**Residential**
The residential sector builds, remodels, and maintains the buildings where we all live. Approximately 50 percent of residential builders construct new homes or apartments. Remodeling, service, and maintenance comprise the remaining 50 percent of activity in this sector.

**Commercial**
The commercial sector builds, remodels, and maintains the buildings where we work, learn, heal, and worship. Also known as nonresidential building construction, the commercial sector represents approximately one-third of overall construction spending on a national level.

**Infrastructure**
The infrastructure sector builds and maintains roads, bridges, water and sewer systems, and other critical public works. Infrastructure workers truly change the world by providing the essential services we humans rely on.

**Industrial**
The most specialized of the subsectors, industrial workers build complex buildings and facilities all around the globe. Power plants, chemical plants, and refineries are built by the industrial construction sector.
Data on the number of workers and companies that make up the construction industry are not hard to find. However, it does take a bit of work to assemble and understand construction economic data to make sense of the industry, and the various industry subsectors to then align an improved talent development system.

To give size and scale to the four subsectors identified above: Americans spend the most money on residential construction, either building single-family homes and apartments or conducting the various types of renovation, repair, maintenance, or remodeling of houses. The other three sectors comprise the remaining 60 percent of construction spending on a national basis, as seen in Figure A (below).

**Figure A. SPENDING BY SECTOR**

![Figure A. SPENDING BY SECTOR](image)

The residential sector maintains its 40 percent share of the market when it comes to number of workers in each sector’s labor force, as seen in Figure B (below). The commercial, infrastructure and industrial construction workforce totals the same 60 percent as in spending.

**Figure B. U.S. CONSTRUCTION WORKFORCE PERCENTAGE**

![Figure B. U.S. CONSTRUCTION WORKFORCE PERCENTAGE](image)

The jobs people do in construction are best divided into five categories. It is important to note that the specific terms used to describe occupations vary greatly. For example, a commercial carpenter is not the same as a residential carpenter. Licensing requirements, qualifications, skills, tasks, and access points for carpentry careers in the residential sector are not the same as for carpenters who want to work in the commercial sector. So just the term carpenter is not sufficient. Most construction occupations have different career paths specific to each of the four industry subsectors.

**CONSTRUCTION OCCUPATIONAL CATEGORIES**

- **CONSTRUCTION MANAGEMENT**
  Specific occupations include: Project Administrator, Cost Estimator, Construction Manager Supervisor, etc.

- **ARCHITECTURE, DESIGN & ENGINEERING**
  Specific occupations include: Architect, Civil Engineer, Surveyor Interior Designer, etc.

- **CONSTRUCTION TRADES**
  Specific occupations include: Bricklayer, Carpenter, Plumber, Heavy Equipment Operator, etc.

- **TESTING AND INSPECTION**
  Specific occupations include: Building inspector, Construction Material Testing Technician, etc.

- **EQUIPMENT, MATERIALS & SUPPLIES**
  Specific occupations include: Materials Engineer, Product Representative, Material Handlers, etc.

MICHIGANCONSTRUCTION.COM
CONSTRUCTION MANAGEMENT

Typically found in the commercial subsector, construction management (CM) firms assemble experts to manage entire construction projects from design to occupancy, including the permitting process and often all financing and financial aspects of a project. Construction managers represent the owner or end-user of the building or facility. Residential builders are the construction managers of the residential sector. CM firms and residential builders hire other companies called general contractors or sub-contractors to construct the projects.

Specific occupations include: Project Administrator, Project Coordinator, Project Engineer, Project Manager, Cost Estimator, and Construction Manager Supervisor.

ARCHITECTURE, DESIGN & ENGINEERING

After an owner identifies the need to construct or alter a building, a team of professional designers goes to work. Long before the project begins construction, the project’s design team has been hard at work transforming the owner’s idea into workable construction drawings, plans, and specifications. These are then used to determine project costs, obtain necessary government approvals, and guide the construction phase of the project.

Specific occupations include: Architect, Architectural Technician, Civil Engineer, Environmental Engineer, Structural Engineer, Mechanical Engineer, Engineering Technician, Interior Designer, Landscape Architect, and Surveyor.
CONSTRUCTION TRADES

If you are ready to lace-up your boots, put on that hard hat, and get down to some real work, then the construction trades are for you. Numerous trades are utilized to build and finish a building. These occupations are hired by the many specialty trades contractors who are the true employment base of the construction industry.

In Michigan, the mechanical trades — electricians, plumbers, HVAC contractors, or boiler operators/engineers — must be licensed by the State of Michigan. Residential builders and residential maintenance and alteration contractors must also maintain a state-issued license. Commercial general contractors or specialty trades contractors not included in the four mechanical trades have no licensing requirements. Michigan’s union building and construction trades are organized into 17 different apprenticed construction trades. The construction trades employ by far the greatest total number of workers in the construction industry.

Specific occupations include: Bricklayer, Carpenter, Helper/Laborer, Electrician, Plumber, Heating, Ventilation and Air Conditioning (HVAC) Technician, Heavy Equipment Operator, Insulator, Iron Worker, Painter, Truck Driver, and many, many more.

TESTING & INSPECTION

A building will stay standing only if the workers built the structure according to the plans, specifications, and codes. Teams of people receive specialized education and training to test many types of construction materials or inspect projects for compliance with design specifications and building codes.

Specific occupations include: Building Inspector, Concrete Testing Technician, Construction Materials Testing Technician, and Industrial Hygienist.
EQUIPMENT, MATERIALS & SUPPLIES

No building or project gets built without wood, concrete, wire, paint, or any of the other products and materials used in construction. The companies that manufacture, distribute, or sell the millions of products consumed by the construction industry also need a wide range of people to handle and sell their lines. Grounded by the hundreds of wholesale distributors, lumberyards, and retail building product outlets in most every community across the state, a description of the construction industry would not be complete without including product manufacturers, suppliers, and distributors.

Specific occupations include: Materials Engineer, Territory Manager, Product Representative, Counter Person, Material Handlers, Sales Person, and Delivery Driver.
A BREAKDOWN OF MICHIGAN’S CONSTRUCTION WORKFORCE

Bringing together our four industry subsectors and five occupational categories proves quite a task. Michigan Construction has derived its own analysis from data extracted from the LMISI data to answer two crucial baseline questions:

1. How many workers are in each occupation category?
2. How many companies service each sector?

Looking first at the number of workers, Figure C (below) shows a total Michigan construction industry workforce of 265,000 workers employed anywhere in the entire construction supply chain from raw material to finished project. The largest number of people work in the Construction Trades, at almost 200,000 people. Design professionals make up the next largest segment of the workforce, followed closely by our estimate of Equipment, Materials, and Supply workers. Construction management firms employ just over 10,000 workers, with the State tracking an underrepresented number of jobs found in Testing and Inspection with many embedded in engineering firms.

A breakdown of occupations tracked by LMISI and included in Michigan Construction’s workforce calculations can be found in Appendix 1.

Figure C. EMPLOYMENT BY OCCUPATIONAL CATEGORY

- Construction Trades - 199,240
- Architecture, Design & Engineering - 28,930
- Equipment, Materials & Supplies - 25,000*
- Construction Management - 10,380
- Testing & Inspection - 2110

*Note: MCF Estimate

Source: MI DTMB LMISI Occupational Employment Statistics
Our formula for this baseline starts with the LMISI Occupational Employment Statistics dataset, drilling down to the six-digit occupation codes level. We then categorized each listed occupation as relevant to one of our five occupational categories. For those relating directly to the industry, the numbers are pretty straightforward. For the Equipment, Materials, and Supplies category, we made an estimate of workers in this occupation category working for companies that manufacture or supply any of the millions of parts and pieces that make up Michigan’s built environment.

The challenge of a straight crosswalk from LMISI data to Michigan Construction categories is amplified when we look at the number of companies or establishments per sector.

Figure D (below) shows the number of establishments in categories as tracked by LMISI and totals 29,648 establishments. The largest employer group contains those companies that actually perform construction: specialty trades contractors. These companies hire the majority of construction trades workers. However, data separating a commercial electrical company from a residential electrical company is not available.

**Figure D. NUMBER OF ESTABLISHMENTS**

![Bar chart showing the number of establishments in various categories.]

This combining of sectors is also found as LMISI tracks construction of buildings along with repair and maintenance. These two categories are not split between construction or repair of commercial versus residential buildings. The most direct sector crosswalk is found with Heavy and Civil Engineering and Infrastructure. As Figure D shows, heavy/civil comprises the smallest number of employers.
CONSTRUCTION’S LOST DECADE

During the period of 2006 through 2016, Michigan’s construction industry underwent a complete labor cycle. Reaching peak employment in 2006 with 178,400 construction workers, the industry then shed over 55,000 workers, dropping to 120,000 in 2010. Since then, construction employment has steadily increased. The latest LMISI data shows the Michigan construction industry employing 174,600 workers.

Note: Michigan Construction utilized the Occupational Employment Statistics dataset, based on employer count through 2016 to establish the total construction industry workforce at 265,000. LMISI uses the Current Employment Statistics estimate of current construction workforce.

Figure E. MICHIGAN CONSTRUCTION ANNUAL EMPLOYMENT 2006-2016

During this decade, we lost almost a third of the workforce. We have gained almost all of those workers back now, having gone full cycle. However, during the same period, we lost a future construction workforce that would fill the openings created by an aging workforce and to meet the ever-growing demands placed on construction companies.

It is easy to understand why no one wanted to enter construction. For so long there were very few openings. Add the collapse in demand for construction services with the mantra that the only way to get a better life than your parents is a college degree — in STEM (science, technology, engineering and math) — and it is easier to understand why finding construction workers has become a challenge.

Now, after a full seven years of growth, demand for construction has out-paced the supply of workers with repeated pleas for more workers coming from all sectors of the construction industry. The challenge now is to inspire and attract a larger pool of candidates with the right skills, qualifications, and character to work construction.
THE CONSTRUCTION TRADES WORKFORCE

In recent months, Governor Snyder has envisioned a revitalization strategy for what used to be called the skilled trades. He has mobilized the new leadership at the Department of Talent & Economic Development (TED) to showcase the many great careers in the professional trades. TED is enthusiastically pushing the Going PRO message, letting Michiganders know they can achieve their Pure Michigan dream without a college degree. Going PRO identifies four industries that utilize professional trades: construction, healthcare, information technology, and manufacturing.

As a state sponsored initiative, Going PRO must serve the broader interests of the entire state and endure change in government. As an employer driven effort, Michigan Construction will attract a larger pool of workers, promote a positive industry image and simplify the way individuals find and connect to opportunities in the construction industry. In a real sense, construction is in competition with the other three Going PRO industries for the best and brightest professional trades workers.

Invariably, when skilled or professional trades and construction are mentioned together, many people automatically think that all construction trades occupations are unionized. Union construction workers play a valuable role in Michigan’s construction industry. The U.S. Bureau of Labor Statistics keeps track of the percentage of the labor force that is affiliated with a union through representation or membership. In Michigan, the overall or all-industry union labor force percentage is 14.4 percent. Drilling down to the per industry level, the national percentage of unionized construction trades is 13.9 percent.

Figure F. CONSTRUCTION TRADES WORKFORCE

Source: U.S. Bureau of Labor Statistics
CONCLUSION

The only way to identify a problem is to face the reality. The data shows us that Michigan’s construction industry faces a very real labor shortage that is only going to get worse. Furthermore, one key solution — bringing in a new generation of skilled workers — is not happening on its own. Social and educational forces have and are pulling those in their 30s, 20s, and teens away from the tremendous opportunities in the construction industry. There is an acute need to rewrite the narrative of working America to include the language of the professional trades.

The only way to begin to solve a problem of this magnitude is to work together as a united industry. Again, the information is available, but every firm in the industry doesn’t have the time or the energy to do this analysis work alone.

Michigan Construction is here to do that work. To name the problem. To work toward solutions. We are your source for breakdowns, analyses, and forecasts on Michigan’s construction industry. We are working every day to understand and explain the magnitude of the labor problem so that the industry can find ways to work together toward solutions.

Michigan Construction is currently working on a construction industry workforce forecast for Michigan. We will release this forecast at the end of the year with one of our valuable Association Partners, the Construction Association of Michigan (CAM). This report will serve as a tool for employers, education or training providers, and other stakeholders in Michigan’s construction talent development system as they find solutions to the construction talent gap.

Together we will understand where the construction industry is going. Only together can the industry inspire more people to want to work in construction.
