bitext

Bitext DLA Platform: Sentence Rewriting

The Sentence Rewriting service takes as input a command to a chatbot and provides a simplified version of the command, reduced to its essential components. This simplified version reduces the training needs of the chatbot and makes sure the bot understands a command that otherwise would have too complex.

For example, for the sentence **"turn off the lights in the living room, please"**, the service will return:

```
[
  "turn off light living room"
]
```

When a sentence has more than one intent, for example for the sentence **"switch on the lights and the tv in the living room"**, the service will separate it into two rewritten sentences:

```
[
  "switch on light living room",
  "switch on TV living room"
]
```
