Waste Water Recycling System

Membrane Water Recycling

Membrane based water treatment uses varying sizes of membranes to filter out contaminants from water based products or waste streams using mechanical separation. Membrane technology can also be combined with other treatment methods when contaminants cannot be filtered out.

Our Aquamizer equipment can filter large flow rates of water based waste streams. The process is automated for operator simplicity with regular membrane cleaning and automatic regulation throughout the system.

As each system is designed based on your specific waste stream and volumes, please contact us and we will help analyze your needs and suggest a system for you.
