## GeoloT Partner Overview

**GISinc's partnership with OSIsoft, the industry leader in operational intelligence connecting people and systems with data to achieve great things provides you with the power to harness your data to address your most pressing business needs.**

OSIsoft's PI System is used in manufacturing, energy, utilities, life sciences, data centers, facilities, and the process industries. PI enables users to manage assets, mitigate risks, comply with regulations, improve processes, drive innovation, make business decisions in real-time, and to identify competitive business and market opportunities.

As an GeoloT Integrator and Esri Platinum Partner, GISinc extends and compliments the capability that Esri and OSIsoft creates, by bringing space and time together. Combining the visualization and analytics of the Esri ArcGIS® platform with real-time data infrastructure delivered by the OSIsoft PI System, gives enterprises a new way to understand and share critical data.

By taking into account physical location, your operational data becomes more complete, has more context and provides new levels of understanding throughout your business. This is accomplished through a thematic map or dashboard, which interacts with them using geospatial analytics.

### Enable Correlations Between:

- Assets and behaviors
  - Real-Time Proximity Alerts through mobile devices
  - Proactively define a safety boundary around assets and be notified if a person or asset crosses the boundary
- Discover dependencies no one knew existed
- Identify inefficiencies in a process or mitigate health and safety risks
- Lead to actionable decisions being made with greater confidence and in shorter times
  - Analyze assets and their environment to determine where, when, and how to deploy new assets or decommission existing ones
- View up-to-the-moment status information of operations and infrastructure
  - Simultaneously compare operating conditions across geography and time

With OSIsoft's PI System and the Esri Operations Dashboard, real-time and historical data can be viewed within a geospatial context — in a single dashboard. Maps that are already being used throughout an organization can be easily augmented with real-time data feeds from the PI System, as a result of Esri's ArcGIS platform.

GISinc, in partnership with OSIsoft, can bring real-time and historical operational intelligence to energy management and conditioned based maintenance.
