Cloud Start

In partnership with

 Microsoft

Want to get up and running in cloud quickly, efficiently and securely? Our Cloud Start framework lets you do just that. Cloud Start is perfectly aligned to suit your operational needs and best practices, so whether you're planning a migration into the cloud or trying to understand how your customers or users could engage with a ChatBot – our cloud gurus are on hand to help you every step of the way.

We break the Start Framework down into three key focus areas to guarantee you end-to-end coverage and to ensure all your burning questions and concerns are addressed, so that you can prepare to migrate with full confidence.

1

Core Configuration

- What platform can I utilise?
- Can you adhere to my security & compliance standards?
- How can I integrate the cloud with my existing services and network?

Our cloud solution architects will guide you through all the key decisions needed to build and configure your cloud platform, ensuring you don't make any decisions that could negatively impact you further down the line (no one wants that!)

2

Management Tooling & Integration

- What tooling is required for managing my cloud platforms?
- Can I use my existing infrastructure tools to manage cloud?
- How do I secure my cloud platforms and the applications hosted within them?

We'll help you understand which existing tools can be used along with the additional tooling you'll need. We will overlay a management and integration layer across the platform to give you a comprehensive operational capability that aligns to your organisation's needs.

3

Service Architecture

- What skills will my team need?
- What process changes do I need to make?
- What processes do I need to implement?

We'll develop a comprehensive service architecture based on your desired target operating model, starting with the operations for the core platform. Your cloud solution architect will then guide you through the key processes and requirements to manage the platform effectively.

We only partner with the best.

All of our core services are based on Microsoft's Enterprise Scaffold, the Cloud Adoption Framework and Gartner's Cloud Management Wheel. You can rest assured your project's in the best hands.
