VULNERABILITY ASSESSMENT AND SOFTWARE SECURITY TESTING FOR OEMS

Known Vulnerabilities
In the crowded security landscape filled with myriad of offerings, it is easy to lose sight of effective measures that actually make a difference in protecting digital assets. New vulnerabilities within networks, web applications and databases emerge every day, caused by software defects and misconfigurations, opening the door to internal or external threats. The majority of organizations fail to take the path of least resistance and address the obvious: to find and fix known vulnerabilities that provide the basis for the absolute majority of attacks. Finding vulnerabilities relies not only on the accuracy of internal and external scan audits, both in on-premises and cloud environments- but also on providing accurate, visible, prioritized and actionable data. Beyond Security, a leading vendor in the areas of vulnerability assessment and software security testing has the right answer by providing solutions that address vulnerabilities before they are exploited by nefarious actors.

Conquering skyrocketing cost of operations by reducing administrative overhead, automating repeatable processes is a business imperative for today's organizations. AVDS is the only automated vulnerability assessment solution in the market capable of offering cost-effective, one-click solution.

Compliance requirements embedded in existing and emerging regulations require empirical evidence proving adherence to stringent data and systems integrity rules. Whether it is PCI conformity, HIPPA compliance or other regulatory requirements, Beyond Security has the right tool to remedy the situation.

Unknown Vulnerabilities
beSTORM intelligently attempts every possible combination of unexpected input to uncover new and unknown vulnerabilities in software, files and hardware. By automatically testing billions of attack combinations, beSTORM ensures the security of products before they are released or deployed, potentially saving companies millions in costs associated with fixing security holes after products are shipped. beSTORM can detect application anomalies and expose all attack paths virtually without user intervention.
