

5 App Tips

Whether you are downloading a new app or updating an existing one - be in the know.

Never delay an update

It's easier said than done but it's important to press "ok" to an update message rather than "remind me later" as those updates are necessary to keep systems safe.

If you don't use it, delete it

Hackers take advantage of outdated design which means that your personal information is at risk if you haven't downloaded the latest updates. If you have any apps on your devices that you don't use, be sure to delete them.

Is it in an accredited store?

If it's not from the accredited "Google Play Store" or "Apple Store" we don't recommend that you download it. This isn't necessarily because the app isn't legitimate but it's because the security of the app would be a concern.

Enable 2FA!

For all of your logins and apps, be sure to enable two-factor authentication (2FA) as this extra layer of protection helps to keep your account and data safe. You can usually set this up in settings, once you have logged in.

Reviews, stars and developer details

When you are thinking about downloading an app, even if it's on an accredited app store, it's good to look at star ratings, reviews and the developers details to help you make an informed decision.

We always recommend a multi-layered approach including multi-layered cyber security support, disaster recovery solutions and user education.
