5 app tips

Whether you are downloading a new app or updating an existing one, get in the know.

1

Never delay an update

It's easier said than done but it's important to press "ok" to an update message rather than "remind me later" as those updates are necessary to keep systems safe.

2

If you don't use it, delete it

Hackers take advantage of outdated design which then puts your information at risk if you haven't downloaded the latest updates. If you don't use it, delete it.

3

Where and what

If it's not from the accredited "Google Play Store" or "Apple Store" don't download it. Not always because the app itself isn't safe but because the security of the app may not be.

4

Enable 2FA

For certain apps such as your bank or email, be sure to enable two-factor authentication (2FA) as this extra layer of protection helps keep your account and data safe.

5

Reviews, stars and developer details

When deciding to download an app, even if it's on an accredited app store it's good to look at star ratings, reviews and the developers details to help you make a decision.

We always recommend a multi-layered approach, which is why a combination of cyber security and disaster recovery solutions as well as educating your team is important.
