

# COMPLETE RECOVERY

Could your business cope if it lost business-critical data? What if you had an unforeseen technical problem or human error led to the loss of vital information? How quickly could your systems be recovered in the event of a disaster?

With a myriad of backup and recovery options available, we will guide you through the process of assessing the risks, and identifying the most appropriate solution for you. We have experience of designing and implementing solutions from simple backups to full business continuity services, making sure that our recommendations find the correct balance for your business between resilience and cost.

## datto

With so many options for disaster recovery and business continuity, organisations are seeking a single, simple solution to the issue. We believe that we have found exactly that with **Datto** from Complete I.T., delivering both onsite and (or) offsite backup, disaster recovery and business continuity.

**Datto** will replicate your IT infrastructure safely and securely onsite and to the cloud, and in the event of a major outage or disaster, you can either restore or boot quickly from this local image, or even use the image in the cloud to continue to operate from other hardware while your infrastructure is re-established.

**Datto** is a full backup, disaster recovery and business continuity service and if rapid recovery of your systems is a priority, then Datto will provide a single, simple solution.

### Online Data Backup

Most organisations now have key data saved on multiple devices (servers, desktops, laptops, PDAs etc.) but organisations are often unsure if all of this data is being backed up. Online Backup offers a flexible option for the encrypted transfer and storage of key data in a secure, offsite facility. With an online backup strategy, automatic or regular backups are created for every device to minimise downtime, allow easy recovery, and ensure that important data is not lost in the event of a disaster.

### Tape Backup and Testing

Tape is still used by many thousands of organisations in the UK to produce regular data backups, and we have implemented hundreds of solutions from single tapes to sophisticated auto-loading systems, often using Backup Exec Suite from Symantec, an industry-leading, robust and proven solution.

Unfortunately, backing-up data to tape is only half the story. Problems can occur when incomplete data is written to them, or when tapes are over-used or worn. Our Data Recovery & Testing service builds a replica server environment to check your backup process and ensure that all essential data is available if needed. plan.
