

CORE SERVICES

MECHANICAL

Developing mechanical concepts, models, and products using real world and digital tools with an eye towards industrial design, user experience, and manufacturability.

ELECTRICAL

Building embedded, digital, power and analog electronics for consumer products, industrial automation, and scientific instrumentation.

SOFTWARE

Designing a variety of software systems, including embedded firmware, cross-platform applications, and device drivers. We leverage existing and off the shelf (OTS) modules as well as develop custom codes to get your product to deployment as efficiently as possible.

We Help You

- Define project specifications
- Design innovative solutions
- Prototype concepts
- Develop and document intellectual property
- Navigate regulatory and safety requirements
- Prepare for and move through manufacturing and production

Whether you need a navigator throughout the entire development process or augmentation of existing resources, we are driven by your success!

We work across a wide range of industries and our local and international clients include:

- Inventors and Entrepreneurs
- Startups
- Established Businesses
- Universities and Research Labs
