Azure API Management

From Zero to Hero in 20 minutes

Defining an API Hero

Fast!

Time-to-market is one of the most common requirement.

“How soon can you have an API up and accessible? This afternoon?”

“Is it possible to have it all up and running by the end of the week?” (asked on Thursday afternoon)

Secure!

Second most common requirement: Make it secure!
(but fast)

“Make sure that only certain users can see this!”

“Can you show me who has access to this API?”

“Is there any industry security standard we can use?”

Nice to Older API's

We need to be able to handle older API's

"I have a lot of SOAP Web Services. Do I need to rewrite them to handle REST?"

"Here is my WSDL for the backend..."

Adaptable

What to do when things change? What to do when things has NOT changed in a while?

“Can I have some extra information in the response back”

“We need to change the backend API a bit...”

“Hey, I hear that API’s is the new way of doing things. Can I get API’s on my old system?”

Never forget a battle

Who is taking notes about all this?

“Where is the documentation, I want to present it to...”

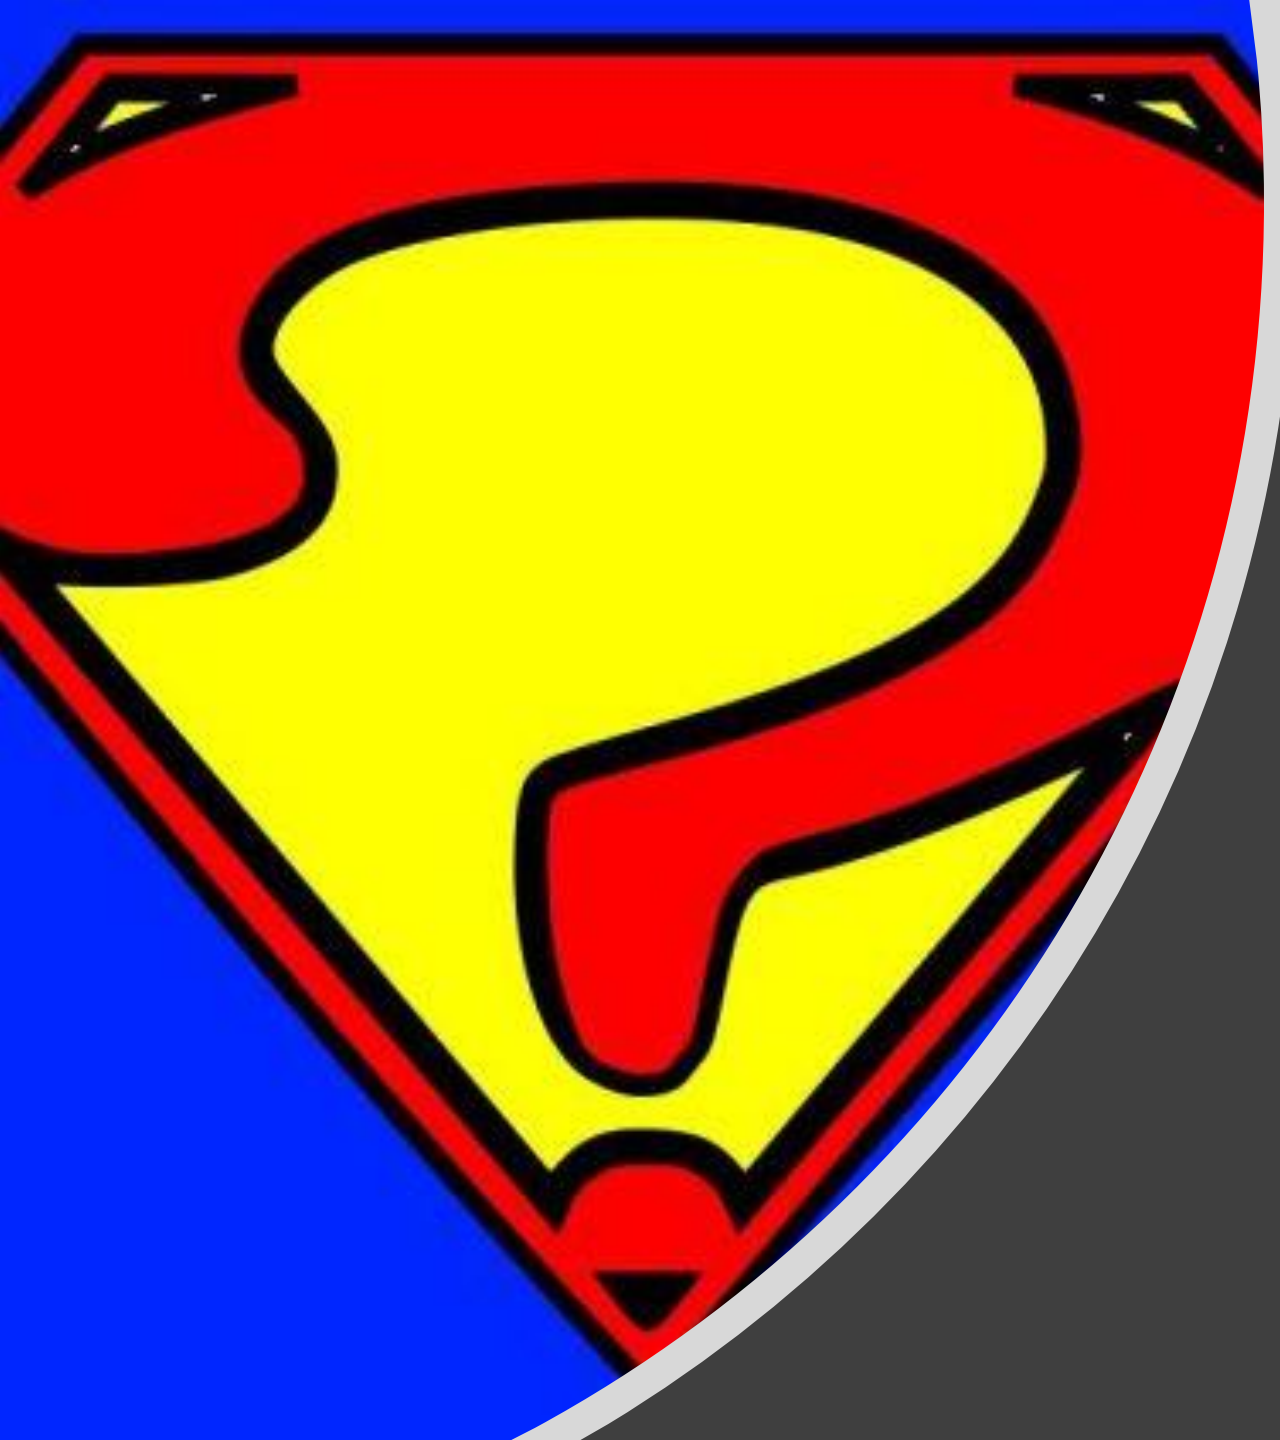

“Where can I read about your API’s?”

“Is the user XYZ really using the API’s?”

“Can we decommission this API? Is anyone using it?”

“User XYZ is claiming problems, what the #*\$! is happening?”

Questions/discussions?

Find me in the Microsoft Tech Room after
the session!

THANK YOU
