

# Cloud security enablement

## The opportunity

In the past one of the major concern and obstacle for organizations to move the cloud have been security related question, but today the advanced and highly automated cloud technology is driving the security area forward to a higher level and in a pace never seen before within the industry.

Organizations can use cloud security solutions in a hybrid setup even if they still host most of their IT solutions on-premise, and investments made in traditional security solutions can be combined with modern cloud driven security solutions to enrich and enhance the security posture and gain better insight into the threat landscape.

### Friction free experience

Provide a built-in experience for secure work from anywhere, on any platform.

### AI & automation

Empower teams against cyberthreats with machine learning and automation.

### Integrated in all levels

Leading solutions that are unified across people, devices, apps and data.

## The solution

Microsoft is now in the forefront of the security area with a strong security portfolio that is very appealing for all organizations having Windows, Office 365 or Azure as part of their it-ecosystem.

Many security related scenarios would benefit from combining security data and telemetry from users and end-point applications together with information from infrastructure and third-party data.

These solutions will bring valuable security insights to organizations that will help them understand and prevent attacks, as well as protect their corporate data from compromise or leakage to competitors.

## The value

Many security analysts is facing a huge burden from triaging through a sea of alerts, trying to correlate alerts from different products manually or using traditional correlation engines, but by using cloud-based security solutions infused with Machine Learning technologies the organization can quickly get value from large sets of telemetry and prioritize automatically threats in their IT-ecosystem.

The modern and cloud-based security solutions will among other bring value in helping the organization to quickly identify compromised accounts used for ransomware injections, accidental or inappropriate sharing of sensitive information and identity theft.

These advanced security solutions works transparently without prohibiting or complicate collaboration between users, customers or business partners, reducing security related noise drastically.

# Cloud security enablement

## The how

The first step is to assess the organization's license entitlements to start enabling all security features and capabilities already invested in through Windows and Office 365 licensing.

The second step is to evaluate the organization's further business needs together with mandatory security and compliance requirements to create a roadmap for the continuous enablement of protection, integrating all possible telemetry and insight into a single source of truth.

Together with the organization we will provide security operations with a cloud powered security platform, including rich automation capabilities and sized for the organizations needs, instead of a platform that would drive avoidable up-scaling of the information security organization.

## Why Enfo

Our values are at the core of our actions; collaboration, trust, continuous development and expertise.

We walk beside our customers in their data-driven business transformation, taking ownership of their transformation as if it were our own.
